CHEMICAL SECTOR LEADS E-BUSINESS

*New Economy a good fit
for would-be dinosaurs*

BY JULIA KING
PHILADELPHIA

Pipelines, production plants, petrochemicals. Eastman Chemical Co. boasts all the brick-and-mortar assets of an Old Economy dinosaur. Yet its Web site, Eastman.com, racks up an average of 3 million hits per month, representing \$200 million in orders last year.

Along with several other would-be rust buckets in the digital economy, Eastman is turning out to be surprisingly swift in transforming into an electronic business.

AT DEADLINE Dell Recalls Batteries

Dell Computer Corp. in Round Rock, Texas, last week announced a voluntary recall of 27,000 batteries that it said could short-circuit, heat up and potentially catch on fire. The short-circuiting problems can occur even when the batteries aren't in use, said Dell. The company said it has received one report of a fire caused by the defect. The batteries were made by Sanyo Electric Co. in Japan and are used in Latitude and Inspiron notebook PCs, introduced by Dell in June, the company said.

Visa Launches Site For Merchants

Visa International Inc. in Foster City, Calif., last week launched a new Global Data Security Web site for merchants and announced new operating policies for protecting confidential consumer information on merchant sites. The Web site (www.visa.com/secured) gives international merchants information about how to meet expanded data-protection standards related to the way Visa account information is stored. The site provides self-assessment tools as well as downloadable guides in Visa's new data-security standards and best practices.

Private Sector Gets Federal Spectrum

The Federal Communications Commission last week transferred 50 MHz of spectrum previously used by government agencies to the private sector. The FCC said the new slice of airwaves allocated for commercial use will support a wide range of services, including voice phone calls as well as "new broadband, high-speed data and video services."

Short Takes

New York-based online designer-clothing retailer BLUEFLY INC. has received a commitment for an investment infusion of up to \$15 million from SOROS PRIVATE EQUITY PARTNERS LLC. . . . More than 300 universities across North America are receiving donated Linux software and services through a program being launched by TURBO-LINUX INC. in Brisbane, Calif.

Unisys Plans Job Cuts After Weak Quarter

But says Win 2000 Datacenter unaffected

BY MICHAEL MEEHAN

Unisys Corp. last week said it plans to cut its workforce by more than 1,000 and de-emphasize some low-margin businesses and products in the wake of a big drop-off in its earnings for the third quarter.

But Unisys assured customers that the cuts wouldn't affect its machines that run Windows 2000 Datacenter, Microsoft Corp.'s newly released operating system that seeks to challenge Unix in corporate computer rooms. Unisys is the sole hardware vendor supporting Datacenter so far.

During a conference call, Unisys Chairman and CEO Lawrence Weinbach stressed the importance of the company's high-end ES7000 server line, which can pool as many as 32 Intel processors.

"We believe there's a big market for that product, and it's one we intend to pursue," Weinbach said.

Informed of the Unisys news, a Microsoft spokesperson said the company was committed to its partnership. "Unisys has already shown tremendous leadership and dedication to the program as the manufacturer of the ES7000, now being licensed by Compaq, HP and ICL," the spokesperson said.

Risky Strategy?

However, in a recent report on Unisys' sluggish earnings, Giga Information Group Inc. analyst David Friedlander blamed the firm's financial decline on Microsoft's slow delivery of Windows 2000.

"Most of its eggs are in one basket: Unisys has put almost

all of its engineering efforts behind Windows NT and Windows 2000," Friedlander wrote. "While its accomplishments in the Windows area have been successful, this is a potentially dangerous strategy if Windows 2000 Server does not gain market acceptance quickly."

The Blue Bell, Pa.-based computer maker and professional services firm reported a third-quarter profit of \$42.9 million, down 69% from earnings of \$138.4 million in the same period last year. Revenue declined 9% to \$1.7 billion, compared with revenue of \$1.9 billion for the period last year.

Unisys said the results were in line with its financial outlook for the quarter. But the struggling company still detailed a series of planned changes following what Weinbach described in his announcement as "an exhaustive

review of our services and technology businesses."

Weinbach said Unisys trimmed 300 jobs during the past three months through a hiring freeze, which will remain in effect for the rest of this year. The company is also offering early retirement to about 1,500 U.S. employees. Unisys had 35,800 employees worldwide last year.

According to the company, it plans to focus its resources through moves such as cutting its portfolio of industry-specific technology offerings from 30 to 15 and reducing its investment in unspecified "low-margin commodity products." In addition, the firm said its outsourcing unit will more aggressively pursue joint ventures and other new ways of doing business, in an effort to increase revenue growth.

More restructuring steps are likely within the next six to eight weeks Weinbach said.

FleetBoston Begins Offering Virtual Safe-Deposit Boxes

Seeks new revenue storing e-documents

BY MARIA TROMBLY

In the latest attempt at generating an online banking revenue stream, FleetBoston Financial Corp. is introducing a new service for what may end up being a pretty narrow market: virtual safe-deposit boxes.

Some smaller companies already provide similar services but haven't gotten a lot of takers, said Paul Jamieson, an analyst at Gomez Advisors Inc. in Lincoln, Mass. Other virtual lockbox services include SafeDepositBox.com in Atlanta, used by Alpharetta, Ga.-based NetBank Inc. and Fort Lauderdale, Fla.-based BankAtlantic Bancorp. Zions Bancorp in Salt Lake City also offers a virtual safe deposit box. Jamieson said he doesn't expect much demand for digital lockboxes, at least initially.

The potential cost of the virtual lockboxes is \$120 per year,

and that's a high price to pay for electronic storage these days, said Richard Bell, an analyst at Needham, Mass.-based TowerGroup.

Nevertheless, Jamieson said he does expect Fleet's banking competitors to jump into the fray, if only to be able to boast to their customers that they offer comparable services.

Last week, Fleet announced plans to launch a system that will let customers to store important electronic documents in password-protected accounts. The FileTrust service is scheduled to be launched at the end of next month in a pilot project aimed at small businesses. It's expected to be followed by an extended ser-

vice for individual customers early next year. Large firms will eventually be able to use customized versions of the technology.

The rollout of FileTrust is related to the new federal law that went into effect Oct. 1 that gives weight to digital signatures and the storage of business documents in electronic form. FleetBoston officials said they expect companies to soon have large collections of legal, tax-related and other documents that need to be kept online in a secure location.

Users will be able to rent space on the FileTrust system and upload or download files via the Web using a personal identification number and a password to gain access to documents, at a cost of up to \$10 a month. Pricing will be based on the features customers use and their existing business relationships with the bank, said Blaise Heltai, managing direc-

tor of global Internet strategy at FleetBoston.

Companies will also be able to set up guest access privileges to let other users like lawyers or accountants view specific files that are stored in their allotted areas of the system.

That could create potential security problems, according to Bell. "It's only as secure as the password," he said, adding that banks require traditional lockbox users to do more than just have a key — they may need to show photo identification, for example.

But according to Robert Erman, general manager of the Boston office of New York-based Plural Inc., which developed the product for Fleet, more security features — such as smart cards — will be added to the system in the future, though he declined to offer time frames for those features.

"One of the trade-offs is having mass availability," Erman said. Customers who use the electronic lockbox to store sensitive documents for use while they travel might not have smart-card readers or retina scanners everywhere they go, he explained.

Fleet also plans to offer services like digital signatures and electronic notarization.

What Good Is a Virtual Lockbox?

FleetBoston suggests the following uses:

- Sharing sensitive legal files with your lawyer
- Sharing financial and tax-related files with your accountant
- Accessing important files while on the road
- Storing digital documents such as contracts

Toyota Web-Enables Dealers, Supply Chain

Following rivals, carmaker projects huge savings in transportation, inventory

BY MARC L. SONGINI
AND LEE COPELAND
SAN DIEGO

TOYOTA MOTOR Sales USA is pushing the pedal to the metal to get its products and operations as Internet-enabled as possible.

The automaker's efforts to streamline its transactions with dealers and its supply chain aren't much different from earlier initiatives driven by rivals such as General Motors Corp. and Ford Motor Co., according to analysts. But Toyota is one of the first automakers to use the Web aggressively to connect with its dealerships, said Karen Peterson, an analyst at Gartner Group Inc. in Stamford, Conn.

Toyota is also the first company to pursue an online replacement-parts aftermarket exchange.

Last week at the Planet 2000 trade show here, sponsored by i2 Technologies Inc., Toyota CEO Yoshi Inaba outlined his company's wide-ranging Web initiatives. They stretch from providing automobiles with wireless access to live traffic and safety reports to connecting Toyota dealers in a virtually paperless communications network across the country.

With the rapid growth in the number of cars sold and models available internationally, success will depend on which carmakers use the Internet to capture and use information most effectively, officials and analysts said.

For its part, Inaba said, Toyota is working closely with Dallas-based i2 to launch what the automaker is calling the Monarch Project, which is aimed at improving operations in Toyota's \$1 billion parts-replenishment business.

Inaba and other Toyota offi-

cials declined to disclose how much the company is investing in the project. But one of its goals is to use Internet connections to speed up communications between dealers and parts suppliers and distributors. i2 software will enable Toyota to order parts based on the time of year or region.

The project, slated to go live by 2002, should enable Toyota to cut its transportation costs by 25% and reduce the "current day's supply of total inventory" by 50%, Inaba said.

A major part of the initiative will be Dealer Daily, a Web-based portal that will connect Toyota's 1,300 dealers with its factories around the clock, improving parts ordering, sales and vehicle repair operations.

For example, dealers will be able to download sales and other company information directly from the Web using a virtual private network and leased lines, said Barbra Cooper, CIO at Toyota Motor Sales USA, in an interview last week. This will prevent

Toyota from having to send two pounds of paper-based updates to dealers each week, slashing about \$3 million in annual printing and distribution costs.

In the long term, Toyota wants to have complete visibility in its supply chain, said Cooper. Suppliers will be able to look at Toyota's parts inventories and automatically replenish them, instead of waiting for Toyota to make a request.

The new i2 system will also allow dealers to instantly

CIO BARBRA COOPER:
Supply-chain data
will be more available

Delphi, Palm Launch Mobile Auto Service For Voice-Activated Dashboard System

In-vehicle Net services targeted for 2001

BY LEE COPELAND

Delphi Automotive Systems Corp. and Palm Inc. last week launched a joint venture aimed at servicing the in-vehicle, mobile Internet services platform the two companies introduced earlier this year.

The San Jose-based start-up, called MobileAria Inc., plans to provide a wireless subscription service to car owners by mid-2001. The deal also allows the world's largest auto-parts maker to cash in on its consumer electronics technologies faster, officials and analysts said.

In April, Delphi inked a deal with Santa Clara, Calif.-based Palm to create the Communiport Mobile Productivity Center (MPC), a voice-activated dashboard port that allows users to access their Palm devices from their vehicles.

At that time, the two companies were also considering a business plan put forth

by entrepreneur Tom O'Gara to launch an automotive mobile services provider.

"In April, we knew we would launch a services business, because the Palm deal only covered the hardware side of the agreement," said Bob Schumacher, director of Delphi's Mobile MultiMedia business unit.

Six months later, that business plan became MobileAria, which is headed by O'Gara and currently has about five employees. Palm and Delphi hold minority equity stakes and

board seats in MobileAria. The start-up also has venture capital backing from Mayfield Fund in Menlo Park, Calif. Officials didn't disclose the amount of the first-round investment.

MobileAria has yet to strike a deal with a cellular services provider. Still, O'Gara said the service will offer voice-activated wireless Internet access that supports applications such as e-mail and Web-based news services.

The pact also allows Troy, Mich.-based Delphi to cash in faster on its telematic (in-vehicle) communications technologies, officials and analysts said. Delphi produces the telematic hardware used with General Motors Corp.'s OnStar roadside assistance and concierge service, but it has taken four years to make the optional equipment available on

THE VOICE-activated Communiport will support e-mail and Web-based news

32 of 54 GM vehicle lines.

In contrast, it took just eight months to get the MPC unit to market, said Schumacher. MPC will be available through retail channels in December.

"The relatively short cycle time for consumer electronics works in Delphi's favor but against the car companies, because it takes five to seven years before they can think about retooling a vehicle," said Jim Hall, an analyst at Auto-Pacific Inc. in Tustin, Calif.

GM will begin a nationwide rollout of a premium OnStar voice-activated e-mail and Web service called Virtual Advisor next month. But the new service will be available only in 2001 models.

Dawn McGreevey, an analyst at Gomez Advisors Inc. in Lincoln, Mass., said consumers have had a long wait — nearly three years — to get interactive Web services from OnStar. Still, she said, she expects healthy demand for the service from drivers who would like to be more productive during their commutes.

Pricing for the MPC unit hasn't been determined, but officials said it will cost less than a Palm VII, which starts at \$399. The 32-bit processor on the MPC allows users to cache and download data from the Palm devices. ▀

TV 'Squatters' Jeopardize Time Line for Wireless

FCC chief says slow adoption of digital television could delay release of spectrum

BY BOB BREWIN

FEDERAL Communications Commission (FCC) Chairman William Kennard last week called television broadcasters "spectrum squatters" that hoard "the most valuable resource of the Information Age." He urged Congress to start charging the stations fees to force them to give up one of the two channels each one now occupies.

Kennard, in a speech at the Museum of Television and Radio in New York, said Congress allocated a second channel to broadcasters at no cost to allow them to broadcast digital TV (DTV) signals while continuing to air programs on their original frequencies.

The broadcasters can operate on both channels until 2006

or until over-the-air DTV serves 85% of the U.S. market. "Given the way that broadcasters are dragging their feet at the moment, we may not see that level of DTV penetration until 2025," Kennard said.

Edward Fritts, chairman of the Washington-based National Association of Broadcasters, said in a terse statement, "Despite the best efforts of broadcasters, digital television's potential remains in part unfulfilled because of FCC inaction on several critical issues."

The broadcasters association said 135 stations currently broadcast DTV. "It is regrettable that Chairman Kennard has failed the test of leadership. Sadly, he is trying to shift the blame for a faltering DTV transition," Fritts said.

According to Fritts, Con-

gress gave the FCC authority to require all television sets to receive DTV channels, establish DTV/cable interoperability rules and require cable systems to carry DTV stations, but the FCC has taken none of those actions.

The FCC intends to auction the portion of the airwaves currently used by broadcasters to air digital signals — Channels 60 to 69 — next spring for advanced, high-bandwidth mobile telephone and data services. But companies that win that multibillion-dollar lottery can't use the spectrum until the stations shift their digital service back to their original frequencies in the Channels 2 through 13 band. The new mobile licensees may have to pay the broadcasters to speed up that shift.

Kennard said Congress could speed up the process by imposing a "spectrum-squatters fee" on broadcasters, starting in 2006. The fee would in-

AT A GLANCE

FCC Chair vs. Broadcasters

■ Calls TV station owners "spectrum squatters"

■ Says they hoard airwaves worth \$70B

■ Says he wants to use the spectrum for Information Age applications

■ Asks Congress to impose fees on broadcasters starting in 2006

■ Says all televisions should be digital-ready by 2003

clude a built-in yearly escalation clause to speed up the process of freeing additional spectrum needed for the development of broadband mobile networks that can support the wireless Web.

Tom Wheeler, president and CEO of the Cellular Telecommunications Industry Association in Washington, said Kennard's remarks illustrate the problem the U.S. wireless in-

dustry faces. "American citizens and entrepreneurs are on the short end of the spectrum stick," Wheeler said in a statement, pointing out that Japan has allocated 300 MHz for wireless, the U.K. 364 MHz and France 395 MHz, while "in the U.S., we are stuck at 189 MHz."

Lawrence Grossman, former president of both NBC's News Division and PBS, said he agreed with Kennard's statements about the broadcasters, but he added that he would like to see a fee imposed immediately.

Jeff Chester, a public-policy advocate at the Center for Media Education in Washington, said the chances of Congress imposing fees on the broadcasters are "slim," not only because of the high level of campaign contributions by broadcasters but also because of "invisible contributions" such as news coverage of campaigns. "No member of Congress will ever criticize broadcasters in an election year," Chester said.

The chances of getting Kennard's proposal through Congress are poor, Grossman said. "But Congress is becoming concerned about spectrum, which has become increasingly valuable," he said. ▶

CERT Narrows Window for Security Holes

Advisory service will report all flaws within 45 days

BY JAIKUMAR VIJAYAN

Users who support public disclosure of security vulnerabilities got an unexpected boost recently.

Carnegie Mellon University's CERT Coordination Center security advisory service last week instituted a new policy under which it plans to publicly disclose all software flaws and vulnerabilities 45 days after they're first reported to the organization.

The policy builds on Pittsburgh-based CERT's usual practice of issuing periodic security advisories to its clients. Until now, such advisories have been restricted only to vulnerabilities that the center

considers particularly serious and in need of immediate attention by users. But as part of the new policy, CERT will start issuing what are expected to be far more frequent "vulnerability reports" on all security problems that are reported to the center and can be proven

true, said CERT member Shawn Hernan.

The new policy is a good thing for users, said Josh Turiel, a network manager at Holyoke Mutual Insurance Co. in Salem, Mass. "I'm a big believer in full disclosure [of security problems]," Turiel said.

"Forty-five days is a very reasonable time for a vendor to fix a flaw. . . . [If] it is not done by then, users should know."

Under the new policy, CERT will pass on all relevant information about a specific security problem to the vendor. But after 45 days — or earlier, if warranted — the information will be released to the public, regardless of whether or not the problem has been fixed, Hernan said.

"The policy is really an attempt to balance the needs of the vendors with those of the general public," he added.

Releasing Info Questioned

CERT's plan to start making more frequent disclosures of software vulnerabilities comes at a time when some security experts are questioning the wisdom of publicly releasing such information.

In a keynote speech at July's Black Hat Briefings security conference in Las Vegas, for example, security researcher Marcus Ranum charged that

the full-disclosure approach isn't improving computer security. Instead, Ranum said, it's only encouraging more attacks by providing would-be hackers with information on how to exploit vulnerabilities to break into systems.

It's a contention that's challenged by security professionals such as Ryan Russell, an MIS manager at SecurityFocus.com, an online bulletin board and security portal in San Mateo, Calif. Last year, the SecurityFocus site posted 575 vulnerability reports.

"I'm firmly in the full-disclosure camp," Russell said. Giving users as much detailed information about vulnerabilities as quickly as possible helps companies take appropriate action to mitigate risks and protect themselves from attacks, he added.

"I would rather run the risk of having someone exploit a vulnerability I know about than have them exploit something I don't know about," agreed Turiel. ▶

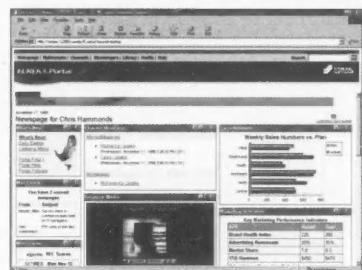

Alerting the Public

A comparison of the number of alerts posted on various security sites last year:

SITE	NUMBER OF ADVISORIES/AIERTS	COMMENTS
CERT:	17	Prior to last week's change in policy, CERT restricted its advisories to the most serious vulnerabilities.
ICSA.Net	34	ICSA breaks its alerts into various categories: Red Hot, Hot, Important Fact and Hype. The number includes all categories.
Security-Focus.com	575	Posts all vulnerabilities reported to it.

Any Data Warehouse Is Only As Good As The Brains Behind It.

With the demand for warehousing skyrocketing, you're juggling immediate eBusiness needs while creating an environment that can scale for future growth. DecisionBase™ is a complete software suite that gives you CA's smartest technologies for designing, deploying, managing, and leveraging your warehouse and other eBusiness applications. Its foundation is the industry-leading PLATINUM® Repository, ensuring a central, shared source of metadata for rapid deployment and better management of your warehouse and eBusiness applications.

What's more, DecisionBase exploits CA's patented, self-learning Neugents™ to mine complex data patterns, predict business problems, and suggest courses of action. Now, you can

capitalize on opportunities before they happen — a huge competitive advantage.

DecisionBase also provides everything you need to help your knowledge workers make faster, better business decisions — from interactive BI dashboards to advanced visualization and portal technology. Plus, our CA Services™ team has the resources, knowledge, and experience you need to succeed.

Remember the name: DecisionBase from CA. It's the industry's most intelligent solution for building your warehouse now. Building it right. And, best of all, building it smart.

Call 1-800-890-7528 for more information on DecisionBase, or visit www.ca.com/decisionbase

Online Retail Sales Could Double This Holiday Season

BY DAN VERTON

Experts predicted last week that fourth-quarter online retail sales will double compared with last year.

The forecast, by Gomez Advisors Inc., an electronic-commerce benchmarking firm in Lincoln, Mass., estimates that online retail sales during the

fourth quarter will reach \$11.4 billion, more than double the \$5.2 billion in sales reported by the U.S. Department of Commerce during the same period last year. This year's growth will be driven by an increase in the number of people who view the Internet as a valuable shopping tool, according to Gomez. It will also be fueled by companies' efforts to improve service — particularly order fulfillment — for existing online customers, the study found.

Bob Smith, executive director of Shop.org, a trade group of online retailers, said he doesn't think Gomez's prediction is unreasonable, and he downplayed the impact higher fuel prices could have on consumer spending in the months ahead. However, fulfillment is a "top-of-mind" issue for all online retailers, said Smith. "Companies are very aware of what they need to do and that delivery on time is not only critical for satisfying the consumer, but getting the consumer to come back," he said.

Most companies this year have increased their investment in inventory planning, inventory management and merchandising, Gomez said. In fact, 81% plan to have real-time inventory management during the upcoming holiday season, according to the study.

Last year, many big electronic retailers got hammered when they entered the holiday buying season unprepared to handle the huge spike in online orders. As a result, the Federal Trade Commission fined seven major retailers, including Toysrus.com Inc., CDnow Inc. and KBkids.com LLC, \$1.5 mil-

Holiday Rush

Online retailers prepare for the holidays

Forecast sales (Q4):
\$11.4 billion*

Major focus of retailers: Customer service and order fulfillment

Major Initiatives:

- Redesigning Web sites
- Using more robust search engines
- Upgrading to real-time inventory management systems
- Moving order fulfillment operations in-house
- Forming teaming arrangements with vendors that have more established distribution centers
- Deploying Internet-based product return systems

*SOURCE: GOMEZ ADVISORS INC.

lion each for not delivering orders on time. "Companies have a better feeling and more responsibility for getting products to the customers at the right time this year," said Barrett Ladd, an analyst at Gomez. "Many of the top toy firms have brought their fulfillment operations in-house, whereas last year they outsourced them," said Ladd.

The forecast by Gomez follows a similar study released last month by Boston-based research firm The Yankee Group, which predicted that online holiday sales would reach \$9 billion this year. Yankee Group officials couldn't be reached for comment, but Ladd said the difference between the forecasts is likely due to differences in the types of companies and services included. ▀

Lack of Privacy Policies Impedes E-Retailers

Lack of clear-cut, understandable privacy policies could be the biggest impediment to online retailers this year as they gear up for the hectic fourth-quarter holiday buying season.

A new study released last week by Cambridge, Mass.-based Forrester Research Inc. and Vividience Corp., a San Mateo, Calif.-based company that specializes in evaluating Web sites, found that the more satisfied online buyers are with a Web site's privacy policy, the more comfortable they will be when they shop at that site.

The Forrester study, "Web Buyers Speak Out About Privacy Policies," surveyed 400 Web buyers and analyzed their attitudes toward online privacy on eight major retail sites. The study evaluated the privacy policies of Amazon.com, Barbie.com, eToys.com, Fisher-Price.com, JCPenney.com, KBkids.com, Toysrus.com and Walmart.com.

The Web buyers rated each site's privacy policies from zero to 100, based on the ease of locating the policy, their overall satisfaction with the policy and their comfort

level in shopping at the site after reading the policy. At least five of the sites received "mediocre" scores of between 60 and 76 because of policies that were difficult to understand or failed to explain terms and principles. The site that received the lowest score, a 39, used a text link that blended into the site's background and made the policy hard to find.

Although Forrester didn't identify the names of the Web sites that earned the mediocre or poor scores, the firm did announce that two of the eight sites, KBkids.com and eToys.com, finished ahead of the rest in all areas evaluated.

Marc Rotenberg, executive director of the Electronic Privacy Information Center, an online privacy watchdog group in Washington, called online privacy the "No. 1 consumer issue." He said online merchants have to do more to convince consumers that their private information won't be misused. "The policies generally are very weak," said Rotenberg. "People still don't trust that their information is not going to be abused."

- Dan Verton

WHAT HAPPENED WHEN WE INVITED THE WEB'S TOP CAR DEALER TO
KICK OUR TIRES?

They took us for a test drive. And liked our performance so much they not only bought our hardware, but our e-business solutions as well. You see, Autobytel.com—the global

leader in automotive e-commerce and services—was looking for help in maintaining its lead and accelerating its growth.

Not surprisingly, the people who came up with the idea of selling cars via the Internet came to another group of e-business innovators: the people at Unisys.

We're helping Autobytel.com with everything from **Unisys e-@ction Enterprise Servers** to building Web sites to handle their global expansion. And we'll be there to see the job through. But, then, with Unisys that's always the deal. www.unisys.com

BRIEFS**TurboLinux Gets \$30 Million Investment**

Linux vendor TurboLinux Inc. last week announced it has received \$30 million in a third round of funding. This is the Brisbane, Calif.-based Linux software company's second cash infusion this year. In January, TurboLinux received \$57 million. The new investment is being made by Fujitsu Ltd., Hitachi Ltd., IBM, Silicon Graphics Inc., Softbank E-Commerce Corp. and other corporate and venture investors.

Nasdaq Adds IT Execs

Nasdaq Stock Market Inc. in Washington, which has been criticized for its handling of some information technology issues, last week named two executives who are expected to help it cope with initiatives such as the conversion to decimal-based pricing and the rollout of a new front-end trading system.

Nasdaq announced that it hired Steven Randich as executive vice president and chief technology officer and appointed Anna Ewing to be senior vice president of systems engineering.

FCC Halts Review of America Online Deal

The Federal Communications Commission (FCC) announced last week that it's suspending its review of Dulles, Va.-based America Online Inc.'s proposed purchase of Time Warner Inc. in New York until after the Federal Trade Commission completes its own review. The FCC said it's "stopping the clock" on consideration of the purchase because the review "may be affected by the antitrust agency's determinations."

HP Puts Focus on Developing Markets

In an effort to narrow the "digital divide," Hewlett-Packard Co. said it will begin an initiative to provide technology and build markets in developing countries. The venture, called e-inclusion, will seek to place some of HP's business focus on developing markets in Africa, Asia, Central and Eastern Europe and Latin America, the company said.

Exchange 2000 Users Laud New Capabilities

But say they're leery of installing the apps

BY JENNIFER DISABATINO
DALLAS

AMID A LAS VEGAS-style display of laser lights and pyrotechnics, Microsoft Corp. officials worked hard to get current and prospective customers pumped up for the company's new line of messaging and collaborative software at the Microsoft Exchange and Collaboration 2000 conference here last week.

Users attending the conference said they were excited about the possibilities Exchange 2000 promises but said they were wary of the complex task of implementation. Some of those users — joint development partners who have begun the process — took part in a panel discussion and said the benefits are worth the effort.

Exchange 2000 has the potential to boost electronic business initiatives by serving as a development platform for corporate Web sites, said Vicki Fredrick, U.S.-based director of the Exchange migration at Aventis, a pharmaceutical con-

glomerate based in Strasbourg, France.

Aventis began to implement a beta of Exchange 2000 earlier this year as a Microsoft joint development partner. Fredrick said that once installed, Exchange 2000 will streamline administration by speeding application distribution and message processing. But the effort, still incomplete, involves a lot of work, she said. "You guys have got a learning curve ahead of you," Fredrick told a group of prospective developers at the conference.

Complex Process

A Microsoft spokesman acknowledged that installation will be a complex process but noted that the company delayed the launch of Exchange 2000 from June in part to expand efforts to make the process more manageable.

"I'm looking forward to the upgrade, but I'm also anxious about it," said Sean Smith, the Exchange administrator at Emery Worldwide in Portland, Ore. Because Exchange 2000 is made up of more discrete com-

ponents than its predecessor, Smith said he will be able to "pass off more of the little stuff" to administrators at Emery's offices, instead of requiring them to download huge attachments.

While he and other administrators may not be 100% ready to start moving to Exchange 2000, Smith said, "How else are you going to learn?"

The panelists offered some suggestions to prospective users. For starters, they said, users need to recognize that Exchange 2000 is built on top of Microsoft's Active Directory, so companies without Active Directory will need to upgrade to that first.

"Know your existing environment," added Tom McCormick, the Exchange administrator at Marathon Oil Co. in Houston, another Microsoft joint development partner. Administrators will have unpleasant surprises if they don't know what they are migrating

AT A GLANCE**Installing Exchange**

Users who have begun installing Exchange 2000 offer the following tips:

- Install Active Directory if your company doesn't already have it.
- Know your current environment.
- Clean up databases as much as possible before moving data to Exchange 2000.
- Expect it to be a learning experience.

to in the new system, he said.

Companies that are considering hardware upgrades may find the installation of Exchange 2000 a good impetus, panelists and other users agreed. But Dan Guttman, Exchange administrator at The MTV Group Inc., the online arm of New York-based MTV Networks, said he didn't have to upgrade his server to implement the new version. ▀

Microsoft Announces New Operations-Management App

BY KATHLEEN OHLSON

Microsoft Corp. last week detailed plans to release new operations-management technology based on software licensed from NetIQ Corp. in Santa Clara, Calif.

The product is for use with Windows 2000 and companion products such as the SQL Server database and Exchange Server e-mail system.

Microsoft said the software is scheduled to be released next summer. Included will be a product called Microsoft Operations Manager and a series of operations-management interfaces supporting technologies such as XML.

Microsoft said it's licensing NetIQ's software, also called Operations Manager, and will do additional development work before making it available to Windows 2000 users.

As part of the three-year deal, Microsoft will pay \$175 million in licensing fees and as much as \$6 million in joint-development funding, according to NetIQ. In addition, the agreement requires Microsoft to invest \$5 million per year in NetIQ and to pay the company another \$5 million annually to cover marketing expenses.

Meanwhile, NetIQ said it will develop a range of management products based on Microsoft Operations Manager for use on non-Microsoft platforms and applications beyond the Windows environment.

Pricing for Microsoft Operations Manager won't be disclosed until the software is ready for shipment, according to Microsoft. ▀

Exchange Moves Toward the Middle

When Microsoft unveiled Exchange 2000 last week, the company demonstrated cross-platform capabilities not previously seen in products from the software maker, analysts said.

This flexibility signals that Microsoft is responding to market forces and opening its messaging and collaboration platform for use with third-party applications, as well as by application service providers (ASP), analysts said.

The Exchange 2000 line is being released to the public this week, setting the stage for the expected release in the first half of next year of the next Office product and the much-hyped knowledge-management tool Tahoe. All are based on the new Web Storage System (WSS) technology.

which will push applications toward a Web-browser interface and will allow users and developers to create and send documents across multiple platforms.

The replication abilities of WSS make Exchange more competitive with Lotus Development Corp.'s Notes, said Dana Gardner, research director at Aberdeen Group Inc. in Boston. Notes, meanwhile, is getting faster at replicating, he said, which shows that Lotus is watching Microsoft.

The market, not June's antitrust ruling by U.S. District Court Judge Thomas Penfield Jackson, spawned the new flexibility, Gardner said. And ASPs will increasingly be able to demand flexibility from software makers, he said.

IBM Bolsters Unix Server Line

Wave of high-powered systems hitting market

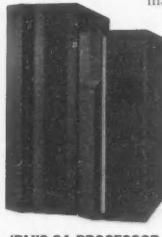

BY JAIKUMAR VIJAYAN

IBM THIS WEEK will boost its high-end Unix server family with a new system that features faster chips, larger memory support and better systems management capabilities, the company said.

The 24-processor p680 server will ship in the middle of next month and features technologies migrated from IBM's mainframes, said Scott Firth, an IBM director.

The server adds to a growing menu of next-generation Unix servers from which users will be able to choose during the next several months.

Within the past few weeks, Unix rivals Sun Microsystems Inc. and Hewlett-Packard Co. have announced major upgrades to their high-end portfolios. Sun announced its first Ultra-SPARC-III servers, and HP announced a 64-processor enterprise server it calls Superdome.

IBM'S 24-PROCESSOR p680 Unix server will ship next month

All of these systems represent a new generation of enterprise Unix servers and should offer substantially better performance and reliability than existing technologies, according to Rich Partridge, an analyst at Port Chester, NY-based D. H. Brown Associates Inc.

All the servers are much more scalable than previous ones and can be partitioned into multiple smaller servers, making it easier for administrators to consolidate multiple applications on a single large server. Similarly, all the products support technologies that allow users to quickly add capacity or remove and replace faulty components without bringing the entire server down.

"It's a new generation of servers that are clearly pushing higher into the data center," Partridge said.

Highlights of IBM's new p680

server include the following:

- Faster, 600-MHz chips featuring IBM's Silicon-on-Insulator technology.
- A mainframelike capacity-upgrade-on-demand feature that allows users to quickly activate additional processors.

■ A built-in service processor for monitoring and managing system performance.

■ Support for up to 94GB of memory.

"We'll probably upgrade to the [IBM] servers" when they become available, said Hugh

Hale, senior manager of information systems at Blue Cross/Blue Shield of Tennessee in Chattanooga.

Hale's company currently uses a 12-processor S80 server — the immediate predecessor to IBM's new system. "The line as a whole has performed well for us," Hale said. "It is reliable and offers very high performance."

Microsoft Opens Second Hands-on Technology Center

Labs help users test e-commerce apps

BY CAROL SLIWA

Microsoft Corp. last week announced the opening of a technology center in Austin, Texas, where users can design, develop and test e-commerce applications in a laboratory setting that may be more horsepower than their internal environments.

The 12,000-square-foot facility, which features Dell Computer Corp. hardware, marks the second of five planned Microsoft Technology Centers. In March, Microsoft opened a center in Waltham, Mass., for

which Compaq Computer Corp. has provided the server infrastructure. Additional centers are planned for Toronto, Chicago and Silicon Valley.

Bob Laskey, the managing consultant overseeing the Austin facility, said his group targets engagements of two to eight weeks to help customers "through the hardest challenges of a development project" and assist them in deploying Microsoft's new line of .Net enterprise servers. Pricing is a weekly flat fee that includes software, hardware, network infrastructure and a team of Microsoft architects.

Laskey said the technology centers differ from prior Microsoft lab-type environments

Center Courting

■ Microsoft has opened technology centers in Waltham, Mass., and Austin, Texas. More centers are planned in Toronto (this month), Mountain View, Calif., (next month) and Chicago (next April).

■ Service offerings include performance tuning and scalability analysis, platform upgrades, security assessment and advanced development.

by offering customers access to a broader range of resources and experts. The Austin center now has five full-time consultants whose focus areas include Windows 2000, SQL Server 2000, Commerce Server 2000, BizTalk Server 2000 and other .Net enterprise servers.

Neil Iscoe, CEO of Austin-based eCertain, said his company spent about \$20,000 for a week of access to the workspace, hardware, software and team of hands-on Microsoft consultants. That investment helped his company, which provides secure transaction services, determine that its Windows 2000 Advanced Server architecture will scale from handling 10,000 transactions per month to the anticipated 4 million transactions per month it expects to process two years from now, he said.

Iscoe noted that eCertain now runs on nine Dell boxes but it tested with almost 30 machines. "You can never do it yourself [in-house] for that amount of money. And if you think of the machines, people and time, the cost can be orders of magnitude greater if you go off in the wrong direction," Iscoe said. "If you have an architecture that doesn't scale, then really, no amount of hardware will be able to fix the problem. So you need to find these things out early."

Compuware Warns of Weak Q2 Earnings

BY JAIKUMAR VIJAYAN

Mainframe software vendor Compuware Corp.'s warning of a weak second quarter may have partly resulted from users delaying signing software agreements in anticipation of new license options being offered for IBM's latest mainframe release, analysts said.

Farmington Hills, Mich.-based Compuware last week warned that its quarter ended Sept 30 would be weaker than expected because of a shortfall in license fees from its mainframe software. This marks the third straight quarter in which Compuware has failed to meet the consensus earnings expectations of Wall Street analysts.

Compuware said earnings are expected to come in at \$474 million to \$487 million, off

sharply from \$568 million in the same quarter last year. License-fee revenue is likely to range from \$100 million to \$105 million, less than half the \$212 million recorded in last year's second quarter, the company added.

Buying on Hold

Part of the \$2 billion company's problems this quarter may have resulted from users waiting for the new usage-based pricing models being offered in connection with IBM's just-announced 64-bit z900 mainframe, said David Foyer, an analyst at consultancy ITCentrix Inc. in Framingham, Mass.

The new IBM systems not only provide nearly twice as much performance as previous mainframes but also support a

new usage-based software pricing model called Workload License Charges, which promises to make software licenses less expensive and more manageable during the next few years.

"A lot of people are going to be extremely reluctant [about]

getting into long-term software license deals without first taking a look at the new option," Foyer said. "There's going to be a lot of reassessment of pricing models."

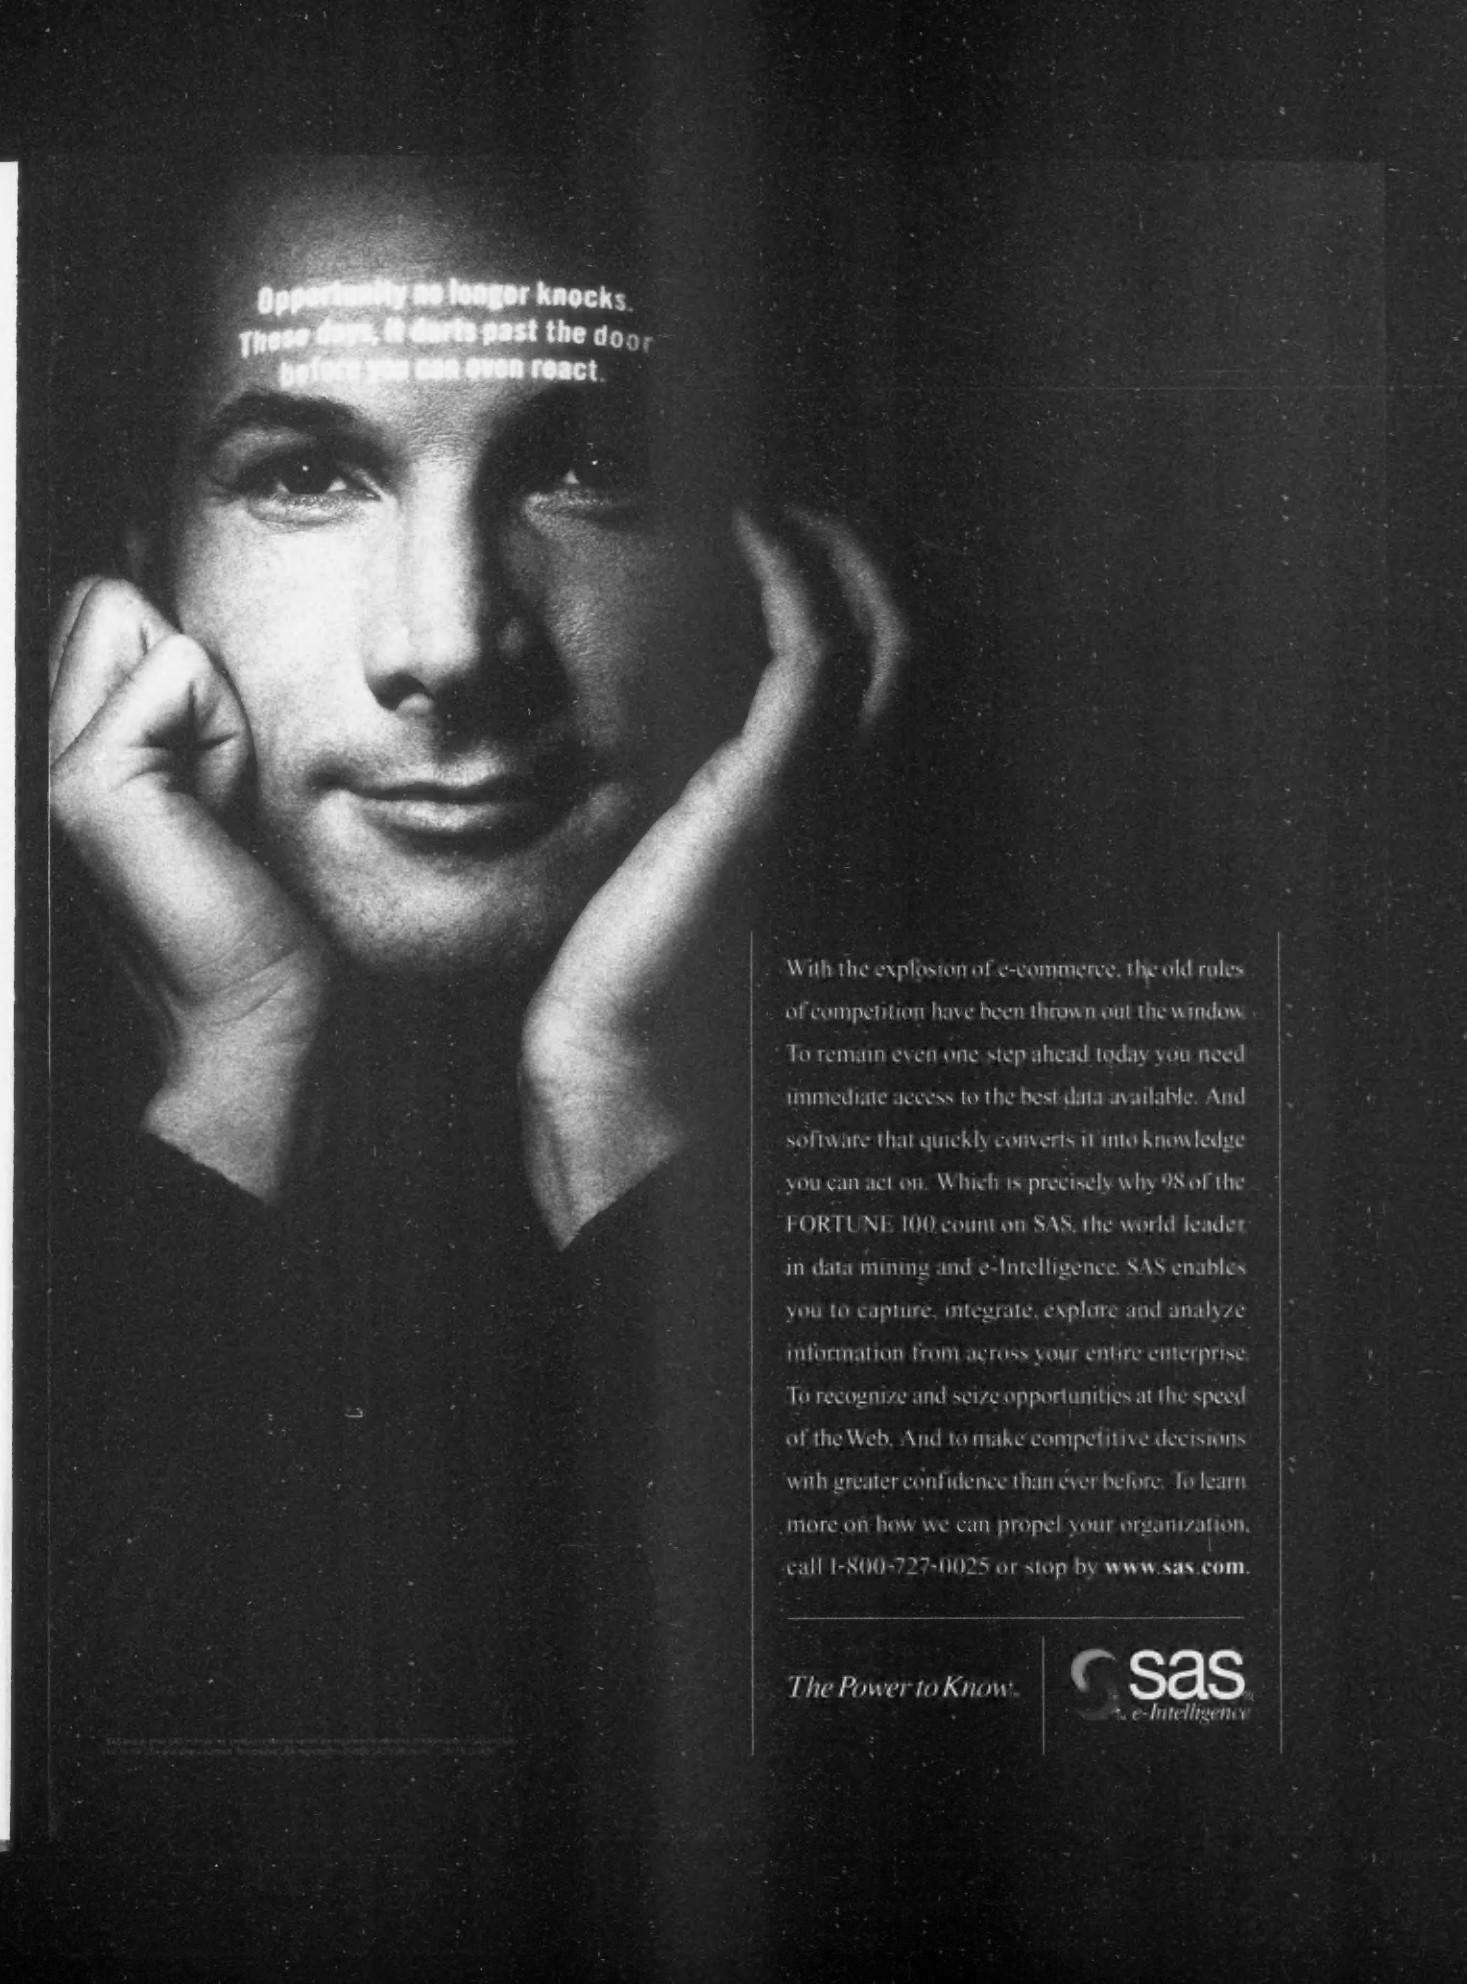

"A part of it has to do with IBM's new pricing model," agreed Judith Hurwitz, president of Hurwitz Group Inc. in Framingham, Mass. There are, however, a number of other factors that may also be contributing to a high-end software slowdown, she said. Many users, for instance, are grappling over whether to sign up for multiyear license agreements, as they have in the past, or for Internet-based application hosting services, she said.

"We are at a very complex time," Hurwitz said. "I think a lot of users are taking a step back and are trying to understand the value they can get out of different kinds of approaches."

Revenue Shortfall

Compuware's estimates for the quarter ended Sept. 30:

Revenue:
Between \$474M and \$487M
Software license fee revenue:
Between \$100M and \$105M
Maintenance revenue:
Between \$110M and \$115M
Professional services revenue:
Between \$264M and \$267M

The Power to Know.

BRIEFS

Intel Waiting on Pentium III Relaunch

Intel Corp. won't relaunch the 1.13-GHz version of its Pentium III processor, which was recalled in August because of a technical glitch, until the second quarter of next year, an Intel spokesman said last week. That doesn't mean users will have to wait six months, however. Intel has said it expects to launch its new Pentium IV processor, expected to debut at 1.4 GHz, before the end of the year.

HP Still Eyeing Pricewaterhouse Unit

Hewlett-Packard Co. is still in talks with PricewaterhouseCoopers about purchasing the accounting firm's consulting division, HP CEO Carly Fiorina confirmed last week. "This potential acquisition is based on a belief that the days of talking to one company about business strategy and another company about technology are over," she said.

H-1B Visa Application Fees to Double

The White House is expected to sign a bill doubling the H-1B visa application fee from \$500 to \$1,000. The fee is charged by employers applying for workers under the program. The money will be used to help fund job-training programs for U.S. workers. Congress approved the increase last week.

Private Firms Getting Federal Competition

Some electronic government initiatives have the potential of competing with private enterprise, according to a study by several economists, including Joseph Stiglitz, a former chairman of the U.S. Council of Economic Advisers. One initiative criticized in the report was the U.S. Postal Service's electronic billing and payment service, called eBill-Pay. Private companies already offer similar services. The report, sponsored by the Computer & Communications Industry Association in Washington, calls for federal guidelines for such initiatives.

Continued from page 1

Chemicals

related, complex, fairly fragmented industry, all of which makes it quite ripe for some form of e-commerce," said Leif Eriksen, an analyst at Boston-based AMR Research Corp.

In AMR's April ranking of the top 20 Internet exchanges, six served chemical companies. That's partly because chemical companies regularly buy their raw materials from other chemical companies, so there's extra incentive within the industry to cut costs by doing business electronically.

"Most chemical companies are buyers and suppliers to each other. Reliance like this spawns a collaborative mentality," said Glenn MacKenzie, director of chemical industry solutions at WebMethods, a San Francisco-based maker of software to link back-end systems and front-end Web sites.

IT Tradition

Compared with other manufacturing industries, the chemical industry also has a tradition of using IT to cut costs and drive innovation, like automating at the manufacturing plant level, Eriksen said.

In addition to its Web site, Eastman has two new Internet ventures — Paintandcoatings.com, an online exchange already up and running for the buying and selling of specialty additives, and ShipChem.com, a Web-based logistics services company for the chemical industry that's set to go live this month. Three more electronic-business spin-offs are due to launch by year's end.

"Our strategy is to get new revenues through new value-added services. Information technology is the value delivery system," said Fred Buehler, director of electronic business at the \$4.6 billion, Kingsport, Tenn.-based specialty chemicals manufacturer.

FMC Corp., a \$4.4 billion Philadelphia-based chemical company, is enabling one of its largest customers, PQ Corp., to place "machine-to-machine" orders for soda ash (an ingredient that goes into other chemicals that PQ makes) and other repeat buys directly into its SAP AG R/3 enterprise system via the Internet.

By the end of December, FMC will integrate 15 more customers into the automated system, which took less than four months to develop and test.

The big advantage is that employees at both the buyer and seller companies now need to pay attention only to those special orders or ones with which there are problems. CIO Edward Flynn told attendees at a chemical industry electronic-business conference here last week. Previously, employees manually handled all orders sent via fax or placed over the phone.

At Wilmington, Del.-based Du Pont Co., electronic business has involved adopting not one but several business models, said CIO Robert Ridout.

For example, the company sells its commodity products on various digital exchanges but sells its wide array of branded materials, such as as Tyvek house insulation wrap and Lycra fabric, via 40 separate branded Web sites.

To jump the online business

Most chemical companies are buyers and suppliers to each other. Reliance like this spawns a collaborative mentality.

GLENN MACKENZIE,
DIRECTOR OF CHEMICAL INDUSTRY
SOLUTIONS, WEBMETHODS

initiatives, Du Pont seeded each of its business units with an electronic-business leader and an electronic-technology leader and very small but focused electronic-business teams.

The company also has put on more than 50 workshops for

Continued from page 1

Supply Chain

efforts. Conaway last week was here at the Planet 2000 trade show, sponsored by i2 Technologies Inc.

In the next two years, Kmart aims to beef up its supply-chain and Web storefront operations, standardize and automate its ordering and fulfillment processes and make sure products get to stores when they're supposed to, said Conaway.

Kmart will also be better able to forecast customer demand for its goods and improve its transportation operations.

Both Troy, Mich.-based Kmart and Caterpillar Inc. announced last week that they are working with Dallas-based i2 to revamp their entire IT platforms to join the electronic-business world.

The applications developed for these companies will eventually be sold to other companies within their industries, according to i2.

The partnership is just what Kmart needs, said Conaway. The company lacks integrated supply-chain processes, he said, and as a result, customers wind up going to stores looking for advertised goods that aren't available.

Moreover, the supply chain is "virtually zero" Web-enabled, he said.

Peoria, Ill.-based Caterpillar plans to let customers order and configure heavy machinery and other products via the Web and create a private online marketplace to connect its network of suppliers and dealers.

The 75-year-old maker of farming and construction equipment, which had revenue of \$19.7 billion last year, hopes to squeeze out \$100 million in costs during the first year the system goes live.

The ordering process on Caterpillar's legacy systems requires too much human intervention and takes too long to offer a build-to-order model for most of the company's customers, according to Bill Smith, a manager in the man-

business-unit executives who are encouraged to generate new ideas for selling their products over the Internet.

"It's all about idea generation," said Ridout. "We showed them sites like [online auctioneer] eBay and [online grocery service] Streamline.com and would ask them to apply the ideas to their own businesses."

On the whole, when it comes to electronic-business initiatives, most chemical companies are "still spending far, far more than they're benefiting," said Robert Koort, a chemical industry analyst at Deutsche Bank AG in New York. But that will change in the coming year, he predicted.

"Those who are going ahead first [with electronic-business projects] are going to be better entrenched with their customer base to the exclusion of those that don't act now. To the extent that IT enables them to make connections, we'll see a differentiation between best-of-class and worst-of-class," Koort said. ▀

ufacturer's corporate information services department.

With a multitude of product options, Smith said, customers could order thousands of different configurations.

Some pieces are in place. Earlier this year, Caterpillar implemented i2's TradeMatrix digital marketplace software in its Performance Engine Products Division, which led to a \$32 million reduction in product inventory and a 38% cut in assembly-line processing times.

However, Caterpillar's plans may not go down well with all of its approximately 5,000 suppliers, said Joshua Greenbaum, a principal at Enterprise Applications Consulting in Berkeley, Calif.

Interfacing with existing public and private online marketplaces is already putting stress on their IT resources, Greenbaum noted. Caterpillar may meet resistance unless it does something to "take away the technological burden" for its suppliers, he said.

Michael Bittner, a research director at AMR Research Inc. in Boston, said that although these are both significant projects that could benefit the two companies, they could also result in long-term, complex implementations. ▀

E-Business Strategies: Building the Versatile Enterprise

Conference includes Best Practice
Awards sponsored by eWEEK

Featuring

Maryfran Johnson, editor-in-chief,
Computerworld

Mark McDonald, co-author of
The e-Process Edge,
a Computerworld book
for IT leaders

Individual attendance is limited to IT managers only.
Vendors, resellers, and consultants should contact
Technology Managers Forum at 212-787-1122 for
exhibiting information.

Pre-registration is required for admission to this event.
Registration is \$295 and includes a one-year membership
in Technology Managers Forum.

Register online www.techforum.com or call 212-787-1122

**It's now standard practice
to depend on Web Applications.**

Guaranteeing Your Net... Web

both diagnostic and corrective tools. Both applications are part of a larger family of enterprise software products. While the first generation of software was designed primarily for large companies, the second generation includes smaller companies, including the electronic commerce industry, Internet service providers, and other businesses.

Now it's time for an industry standard to manage them.

Let's face it. You have to be on the leading edge of what has become known as e-business. But you cannot afford to lose sales, customers and brand reputation because of failed transactions. So your systems must be more than excellent. They must be failsafe.

Relax. Tonic has arrived.

Now you can feel comfortable about your company's dependence on web applications. Because the Tonic enterprise solution heralds a new era of web applications management.

Load testing and integrity assessment before going live. And on-going monitoring of systems beyond anything previously offered by a single company. That's Tonic.

Active within hours, not days. Easy to use with no retrofitting of your systems required. But with the scalability to simulate millions, not just thousands, of simultaneous users. After all, you plan to be that successful, right?

Suddenly the leading edge is a much more comfortable place to be.

Energy Companies Form Software Venture

Houston-based OpenSpirit should create new standards for energy industry

BY KATHLEEN OHLSON

CHEVRON CORP. and Royal Dutch/Shell Group have teamed up with a software unit of Schlumberger Ltd. to establish a jointly owned venture that will market a vendor-neutral application-integration framework for petroleum exploration and production activities.

The new venture, Houston-

based OpenSpirit Corp., plans to continue developing collaboration and information-sharing technology that was created by a wider group of energy companies and software vendors. That group was known as the OpenSpirit Alliance.

San Francisco-based Chevron, The Hague-based Shell and New York-based Schlumberger said a commercial release of the OpenSpirit tech-

nology should be ready for shipment this quarter.

The companies will own equal shares of the venture, with Schlumberger holding its stake through its GeoQuest business unit. Houston-based GeoQuest markets software and data-management services to petroleum companies.

The OpenSpirit framework was previously marketed by PrismTech Ltd., which has licensed the technology to the new OpenSpirit venture. PrismTech developed the middleware, but the oil companies wanted technical ownership

and the ability to extend the framework, so they bought it from the U.K.-based software vendor, said Steve Jennis, PrismTech's CEO. Terms of the deal weren't disclosed.

Cross-Platform Development

The OpenSpirit technology is based on standards such as Needham, Mass.-based Object Management Group Inc.'s Common Object Request Broker Architecture, and it supports cross-platform development and deployment of software on Unix and Windows NT systems.

Randall Nottingham, an analyst at The Yankee Group in Boston, said OpenSpirit will improve efficiency for energy companies.

"Communications [between petroleum companies] are notoriously complicated and difficult" because the companies have proprietary electronic document systems for each business relationship, Nottingham said.

The software would enable companies to communicate through a central network, exchanging information and files, he said.

But OpenSpirit is competing with other groups, such as the Oil Field Services Portal in Houston, to adopt standards for energy companies.

"They can't all be successful, but some parts [from each group] will be adopted," said Nottingham. ▀

Automaker Consolidates E-Commerce

DaimlerChrysler to launch \$500M Net-focused unit

BY KATHLEEN OHLSON

Furthering its effort to catch up to rival automakers such as Detroit-based General Motors Corp. and Dearborn, Mich.-based Ford Motor Co. on the Internet, DaimlerChrysler AG last week said that all of its e-commerce operations and investments are being consolidated into a new subsidiary being launched with \$500 million in funding.

The subsidiary, called DCX Net Holding, was described by Stuttgart, Germany-based DaimlerChrysler as the nucleus of a corporatewide e-commerce initiative aimed at cutting operational costs and making the company more efficient and agile in

areas ranging from purchasing to development, production and sales.

DaimlerChrysler said DCX Net will be responsible for overseeing its business-to-business, business-to-customer and business-to-employee activities.

Included in the initiative is the company's ownership stake in Covisint, an online exchange created jointly by DaimlerChrysler, Ford and GM. DCX Net will also manage existing investments, which total \$290 million, in e-commerce companies such as Powerway Inc. in Indianapolis and The Cobalt Group Inc. in Seattle.

The subsidiary "will forge alliances, enter into joint ventures and invest to promote [our] e-business activities," said Eckhard Cordes, the DaimlerChrysler management board member responsible for corporate development and information technology. In addition, DCX Net will oversee DaimlerChrysler's interest in Venturepark Incubator AG, a Berlin-based venture-capital firm that invests in e-commerce companies.

Heading the new subsidiary are John Stellman, vice president of mergers and ac-

quisitions at DaimlerChrysler, and Olaf Koch, the company's vice president of corporate e-business.

DCX Net will have offices in New York, Detroit, Tokyo, Stuttgart and Palo Alto, Calif. It will receive support and tech-

nical advice from the DaimlerChrysler research lab operation, the company said.

DaimlerChrysler was slower to detail its e-commerce plans than Ford and GM, but it began announcing a series of Internet-related projects this sum-

mer. Included are an upgrade to its Web sites aimed at U.S. auto buyers and an internal Web-based technology infrastructure that's intended to link all aspects of its vehicle design, production and marketing operations. ▀

Nobel Physics Prize Awarded to IT Pioneers

Kilby invented integrated circuit

BY JOY PARK

Jack Kilby, an inventor at Texas Instruments Inc. who developed the first integrated circuit in 1958, last week was jointly awarded this year's Nobel Prize in physics along with two other scientists who also were cited for work that "laid the foundations of modern information technology."

Sharing the award with Kilby are Herbert Kroemer, a physics professor at the University of California at Santa Barbara, and Zhores I. Alferov, who is the director of the A. F. Ioffe Physico-Technical Institute in St. Petersburg, Russia. Kilby was given half the \$915,300 prize by the Royal Swedish Academy of Sciences in Stockholm. Kroemer and Alferov will share the other half for their separate individual efforts to develop the semiconductor technology used in transistors.

In an explanation of the physics award, the Royal Swedish Academy noted that Kilby, 77, and the late Robert Noyce of Intel Corp. are both considered the inventors of the modern integrated circuit. Kilby created the first device, while Noyce developed a chip as it would later be manufactured, using materials such as silicon and silicon dioxide, the academy said.

However, Kilby "was first with his patent application, and Noyce knew of this work when he filed his own application" related to the technology, the Swedish academy added. Although Noyce wasn't eligible to share in the Nobel award because of his death in 1990, the academy lauded him as

"one of the most important founders of Silicon Valley."

Kroemer, 72, was cited for developing semiconductor heterostructures consisting of layers of gallium arsenide or aluminum gallium arsenide while working at RCA Corp. and Varian Associates Inc. in the 1950s and early 1960s. Alferov, now 70, did similar, though separate, work in Russia during the 1960s.

Kroemer's work showed that transistors based on heterostructure technology could be superior to conventional ones, especially for amplifying currents and for high-frequency applications. Devices and semiconductor lasers based on heterostructures are used in satellite communications and in products such as optical data storage systems, mobile phones and CD players. ▀

JUST THE FACTS

All Rolled Into One

DCX Net Holding:
■ Will receive \$500 million in funding from parent company DaimlerChrysler AG

■ Will include business-to-business, business-to-customer and business-to-employee activities, as well as online exchange Covisint

First Data Spins Off E-Payments Company

Disparate payment systems to be bundled under eOne Global umbrella

BY MARIA TROMBLY

IT MAY BE A LITTLE late getting into the game, but Atlanta-based First Data Corp., the leading credit-card processor in the U.S. and owner of Western Union Holdings Inc., launched a \$600 million electronic-payments company last week called eOne Global LP.

The company will combine all of First Data's electronic-payments businesses, including a business-to-business payments service for use in online

exchanges and a tool that lets companies electronically pay federal and state taxes.

But except for the tax business, all of the online payments battlegrounds are already dominated by other, quicker companies, according to Paul Jamieson, an analyst at Lincoln, Mass.-based Gomez Advisors Inc. First Data has to move fast to gain ground on the dot-com start-ups, he said.

"This is their way of playing catch-up," Jamieson said. "Quite frankly, that should have been

done a year ago.

"It is the small start-ups that are looking at niche innovative processes that either enhance or create a whole new segment in the online payments area," he continued. "That's where the innovation is happening."

Planning to Expand

First Data has bundled all of its disparate electronic-payment businesses under the umbrella of eOne Global.

For example, eOne Global's SurePay, a joint venture with Plano, Texas-based Entrust Technologies Inc., will provide a way for companies to make secure payments to other businesses in online exchanges and

to consumers. But it won't be up and running until the fourth quarter, according to Garen Staglin, president and CEO of eOne Global.

Another division of eOne, CashTax, enables companies to pay taxes to the federal government and 20 states. It's a leader in its field, with 2 million business clients making 36 million annual payments worth more than \$1 trillion.

eOne Global also plans to expand into a variety of other electronic-payments products.

Take person-to-person electronic payments. Currently, the leader in this space is X.com Corp.'s PayPal. However, PayPal has recently begun charg-

AT A GLANCE

Crowded House

eOne Global is planning to move into a crowded business-to-business payments field.

Used by: Businesses to send money to vendors and suppliers on online exchanges

Leader: None yet, but several players are emerging, including Financial Settlement Matrix.com, a consortium that includes Citigroup Inc., Wells Fargo & Co., and software maker i2 Technologies Inc. Another contender is Clarent Corp.

ing for some of its services and has announced plans to raise rates even further, giving potential competitors a chance to break into this market.

First Data will own 75% of eOne Global. The other 25% will belong to iFormation Group, created by The Goldman Sachs Group Inc., The Boston Consulting Group and General Atlantic Partners LLC to back online businesses. ▶

Volunteer Brings Computers to the Bedouin

Third World land gets boost from IT

BY MARIA TROMBLY

Sean Osner returned to Egypt from Jordan three weeks ago. He was in a Bedouin community of between 1,500 and 2,000 people in a village called Safawi, close to the country's border with Iraq. "It was like Mars," he said. "That kind of terrain — very barren. Lots of rocks around."

Osner set up a community center with 10 Intel 486 computers and five Pentium IIIs for the local residents — mostly shepherds and goatherds — to share with four nonprofit women's organizations.

At first, it might seem that Bedouins would have no need for the Internet, especially compared with more basic concerns like food and shelter. But the Internet can help local residents get better medical care and education and it may even help bring money into the community.

"One of the things we designed the community center for was to help the local women find markets in other

parts of the world for their products," Osner said. "That would keep those traditions alive in their community."

Osner's trip to Jordan was on behalf of the United Nations Information Technology Services (UNITeS), which received a mandate from UN Secretary-General Kofi Annan this past spring to bridge the digital divide in Third World countries.

Working on another IT-related assignment for United Nations Volunteers (UNV), which coordinates the volunteers for the UNITeS program, Osner (sean@tacc.ednet.net) recently visited the Egyptian village of El Ghar. There were 400 phones for 100,000 people, and those 400 phones shared a single phone line.

'Overwhelming Demand'

At a technology access community center in the Egyptian city of Zagazig, which has around 1 million inhabitants, 4,000 people were waiting for a chance to use one of four available computer terminals. "There is an overwhelming demand that we can't possibly fill," Osner said.

Visitors, many of whom —

even the university students — have never touched a computer, learn how to use word processors and e-mail, do Internet searches and set up e-commerce sites.

One page set up by a local entrepreneur can be found at www.tacc.egnet.net/tacc/rabab. Rabab's Leather Products is a one-stop shop for made-to-order outerwear.

While Osner's Jordan assignment was for only two weeks, other missions can last as long as two years, said UNV spokeswoman Nanette Braun.

Volunteers receive travel expenses, insurance and a living stipend that varies by country but usually amounts to between \$800 and \$1,500 per month. People can apply by visiting the UNV web site at www.unv.org.

Mutual Benefits

Experts say the volunteers could play a key role in helping businesses in developing countries hop on the New Economy bandwagon — not just in setting up the computers but in teaching people to use them.

"The shortage of skilled people is one of the biggest problems developing countries face in joining the digital revolution," said Bruce McConnell, president of McConnell International LLC, which does technology and management policy consulting in more than 120 countries.

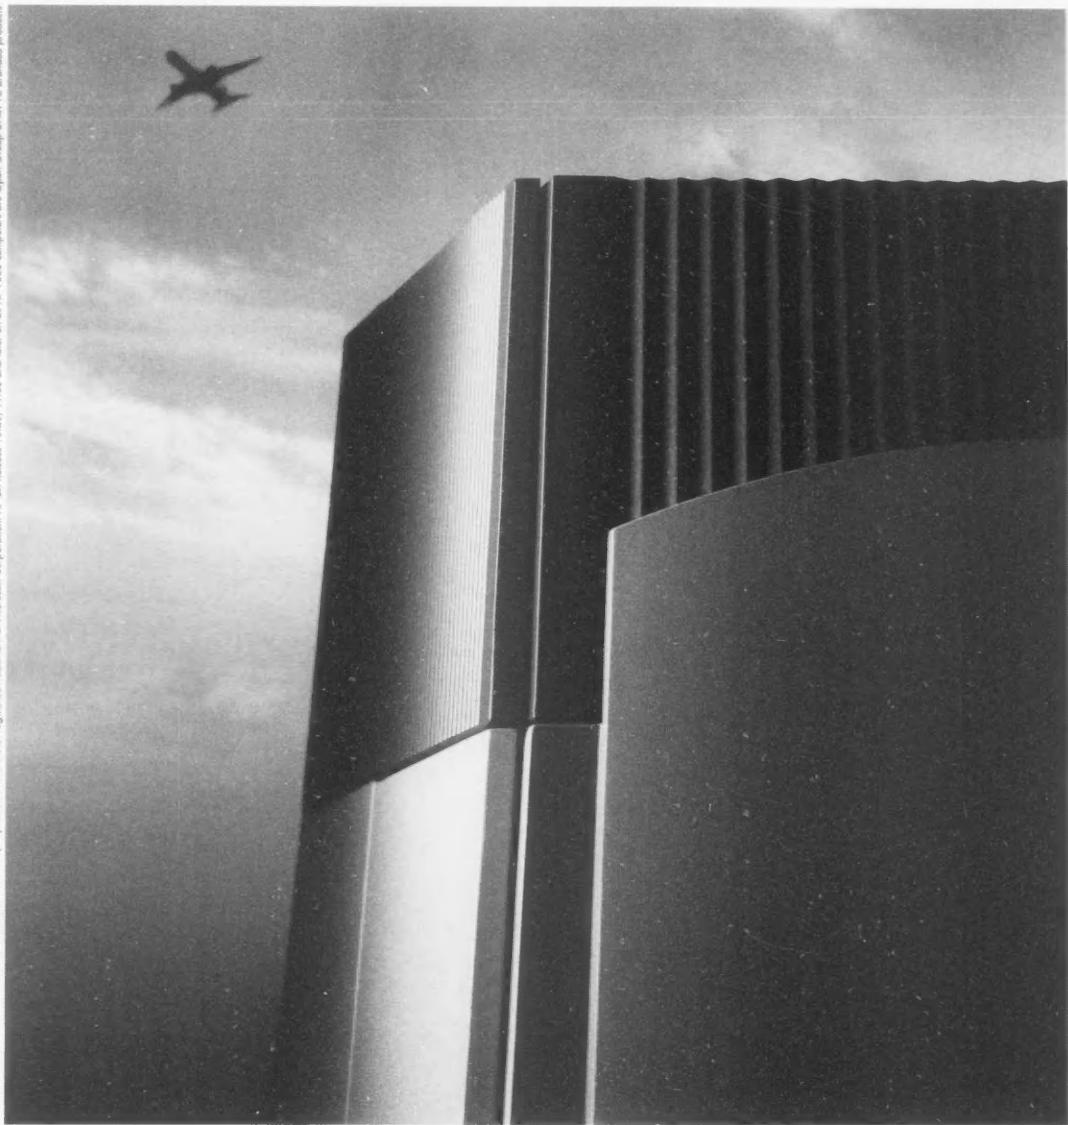

And not only the local economy benefits, said Ernest Wilson, director of the Center for International Development at the University of Maryland in College Park. Markets are expanding fast in developing countries, he said, and that's one reason companies like Cisco Systems Inc. and Motorola Inc. have been active in overseas education efforts for years.

For example, Cisco donated \$3.5 million to UNITeS in July for educational programs in more than half of the world's least-developed countries and said it would deliver the investment through its global Cisco Networking Academy. "That's where the markets are going to be," Wilson said.

So far, 23 UNITeS volunteers have taken assignments in developing countries, including Benin, Botswana, Burundi, the Central African Republic, Ecuador, India, Namibia, South Africa and Tanzania. Six additional posts are in the pipeline for Bhutan, Jordan and Mongolia. For more information about the project, visit the UNITeS Web site at www.unites.org. ▶

Most servers replace yesterday's servers. This one replaces tomorrow's.

Introducing hp 9000 superdome, the first enterprise server with the flexibility to match its power.

Flexibility that's ready for IA-64, and flexibility to run multiple operating systems like HP-UX, Linux, Windows 2000, and others yet to be. Capacity is flexible too. Scale it up or scale it back, paying less when you use less.

With hp 9000 superdome, your options are open. Because tomorrow's another day. hp.com/superdome

First Linux Development Platform Standards Are Released

BY TODD R. WEISS

The first version of the new Linux Development Platform Specification (LDPS) was re-

leased last week, clearing the way for the adoption of standards that will make participating Linux platforms work

together seamlessly.

The announcement was made by the nonprofit Free Standards Group at the Fourth Annual Linux Showcase & Conference in Atlanta.

The new LDPS standards will be adopted by some of the

largest Linux distribution companies, including Caldera Systems Inc., Corel Corp., Red Hat Inc., SuSE Linux AG, TurboLinux Inc. and VA Linux Systems Inc., the group said.

"This is a big thing," said Scott McNeil, an open-source strategist at VA Linux Systems in Fremont, Calif. "Predating Linux, Unix was always trying to be unified, with no success." Now, with the adoption of Linux specifications, the future of Linux standardization looks brighter, he said. "To come out with the first version of a new standard is big stuff."

The specifications will mean that Linux developers will be able to work with standardized tools, kernels and libraries that will allow their applications to function properly across other Linux distributions, McNeil said.

Broader Use

By using the LDPS, developers will be able to create and distribute software more quickly across the spectrum of Linux distributions, including Caldera OpenLinux 2.4, Conectiva Corp.'s Linux 5.1, Corel Linux OS Second Edition, Debian GNU/Linux 2.2, Linux-Mandrake 7.0, Red Hat Linux 6.2, SuSE Linux 6.4 and TurboLinux 6.0, according to the Free Standards Group.

"Standards allowing interoperability and portability are of crucial importance for Linux," said Dan Kusnetzky, an analyst at International Data Corp. in Framingham, Mass. "Survey after survey indicates that IT management will feel comfortable adopting Linux only when they feel confident that applications based upon one distribution of Linux will be easily transportable to other Linux platforms."

Dan Quinlan, president of the Free Standards Group, said in a statement that "LDPS is but the first of many planned specifications that are aimed to help both open-source developers and companies port applications to Linux. Having a single development reference to work from will greatly simplify the process of building Linux-based applications."

The Free Standards Group is a nonprofit corporation organized to accelerate the use and acceptance of open-source technologies through the development, use and promotion of standards. ▀

High-Speed Intrusion Protection for the Enterprise

Don't leave your Gigabit and Fast Ethernet segments exposed to hackers and insiders. Our award-winning intrusion protection products guard high-speed segments and servers better than anyone else in the game.

We deliver centrally managed agent- and network-based protection to every server or segment, VPN client or desktop in the enterprise, inside or outside the firewall. The other guys can't.

A box without service is a box.

With hp people, hp 9000 superdome becomes a solution, instead of a server.

Service is comprehensive and included. We handle site planning, integration services, customized training, and monitoring.

It's service made simple. So simple, in fact, that we can adjust your capacity over the phone.

Without, ironically, a service call. hp.com/superdome

BRIEFS**Notes App Vendor to Work With Exchange**

Cambridge, Mass.-based IT Factory Inc., the world's largest independent vendor for Notes-based applications, announced last week that it's working with Microsoft Corp. to build collaborative applications for Exchange 2000 products and a standard architecture for both platforms. CEO Lars Munch Johansen said IT Factory isn't abandoning its Notes users but is trying to open up applications, which may include helping customers migrate from Lotus Domino/Notes to Exchange.

IBM to Build Plant

IBM last week announced plans to build a \$2.5 billion chip-making plant in East Fishkill, N.Y. The company said the plant is part of its \$5 billion capital-investment plan to support its semiconductor business.

Intel Reshuffles Execs

Intel Corp. last week announced three high-level management changes: Mike Splinter is now executive vice president and general manager of the technology and manufacturing group; Paul Otellini will take over management responsibility for the Intel Architecture Group; and Albert Yu, a senior vice president, will run an emerging-business unit.

NEC, Hitachi Agree to Optical Net Alliance

Furthering an alliance that began with memory chips, Japan-based firms NEC Corp. and Hitachi Ltd. have agreed to develop optical networking systems together. Products resulting from the alliance are expected to be rolled out between April and September next year.

Gateway Hit With Suit

A class-action lawsuit filed last week in California alleges that San Diego-based Gateway Inc. misled customers when it offered free Internet access but did not reveal that many users might incur long-distance telephone rates when connecting to the service. A Gateway spokesman declined to comment.

Oracle: More Than Just The Database These Days

Condensing 75 products into two is firm's latest move in becoming an e-business

BY DAN VERTON

WHEN ORACLE Corp. CEO Larry Ellison called the PC "a ridiculous device" at the European IT Forum in 1995, many industry lookers chalked up his comments to little more than a personal rivalry with Microsoft Corp. Chairman Bill Gates.

However, when Ellison repeated those words at this month's Oracle OpenWorld conference in San Francisco, people listened as Ellison described Oracle's transformation from a database vendor only to a full-fledged e-business focused on the Internet.

"Software is destined to become a service," said Ellison. "We look at every application service provider not as a threat but as a potential customer."

According to Ellison, Oracle wants to change the way software is manufactured and sold. As a first step, the company has embarked upon a somewhat risky plan to consolidate its 75 different product offerings into two Web-centric packages.

"We engineer our products to work together. It's a fundamentally different view of the world" — one that's particularly different from the traditional systems integration model, Ellison said.

And Oracle has taken steps to prove it. In fact, according to Chuck Rozwat, executive vice president for server technologies, the company saved a billion dollars last year by "eating its own dog food" — that is, by using its own software to convert Oracle from a traditional business to an e-business.

Users seem to be paying attention. "We're seeing the shift to the Internet in our users as well," said Rich Niemiec, president of the International Oracle Users Group in Chicago. "The fact that they use their own software is huge. Users think [Oracle]

is more likely to fix glitches."

The key factor in Oracle's plans has been its recently released Oracle9i Database server and Oracle9i Application Server (iAS), which consolidates more than 75 of the company's products. The iAS release also includes a patent-pending Web-cache technology that works with server clusters to dramatically increase Web performance and is able to tolerate machine failures.

"Oracle is far more than a database company," said Phil Russom, director of business intelligence at Hurwitz Group Inc. in Framingham, Mass. "In hindsight, I can now see that what I once thought was an unrealistically aggressive and possibly dangerous product

consolidation plan has now turned out to be a long-range and accurate vision of what is required for a broad, scalable and robust platform for Internet-based applications."

However, the consolidation of products has both an upside and a downside, said Russom. Although it may simplify licensing and integration for many customers, he said, oth-

AT A GLANCE**Bringing in The Bucks**

Oracle's growth for the first quarter of fiscal 2001:

Revenue: \$2.3B

Net income: Up 11% to \$501M

Database licenses: Up 32% to \$585M

Application licenses: Up 42% to \$156M

Service revenue: Up 8% to \$1.5B

SOURCE: ORACLE CORP., SEPTEMBER 2000

ers may be forced to buy the application server in order to get the individual products they need, such as Oracle's reporting tool. "This may increase integration tasks and may possibly increase the cost of the software," he noted.

And many long-time Oracle users say they aren't happy with pricing changes that have accompanied the new products. Some customers told *Computerworld* that they're so upset by what they view as exorbitant capacity-based pricing that they're actively evaluating alternatives to Oracle [*News, Sept. 18, Oct. 9*].

There are other risks to Ellison's long-term vision as well. "I think the main missing element of their ASP platform is a competitive [Enterprise JavaBeans] application server," said Mike Gilpin, an analyst at Giga Information Group Inc. in Cambridge, Mass. ▶

Wall Street Whacks Tech Stock Values

BY KATHLEEN OHLSON

The fall is proving to be more than just a season for many technology companies, including Apple Computer Inc. and Dell Computer Corp.

Apple and Dell were on a long list of information technology vendors that last week warned Wall Street that their earnings for the quarter ended Sept. 30 will fall below expectations. Others on the list include Intel Corp., Silicon Graphics Inc., Storage Technology Corp., Compuware Corp. and Lucent Technologies Inc.

Apple dropped a bombshell Sept. 28, reporting that fourth-quarter operating earnings would be about \$110 million — 33% lower than the \$165 million expected. On Oct. 4, Round Rock, Texas-based Dell said its third-quarter earnings would grow only 7% over second-quarter sales of \$7.67 billion.

Apple's stock experienced Wall Street's wrath, falling from \$53.50 on Sept. 28 to

\$19.63 in trading last week. Dell's stock remained steady, dropping from \$28.19 Oct. 4 to \$23 in trading last week.

Analysts said PC manufacturers are suffering as a result of lower consumer demand.

"People have already bought the equipment they need, maybe because of Y2k, so there's a backlash," said Terry O'Brien, an analyst at Branch, Cabell & Co. in Richmond, Va.

Consumers don't need a new computer, even with the releases of Microsoft Corp.'s Windows 2000 and Intel's Pentium IV, O'Brien said.

Additional Factors

Concerns over higher interest rates, a European economic slowdown, the value of the euro and higher oil prices also helped produce lower PC sales, according to analysts.

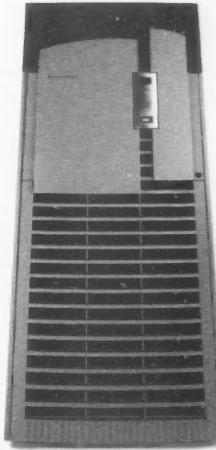

"Investors will stay on the sidelines with PC manufacturers ... going forward," O'Brien said. Investments will stay flat

or decrease during the next six months or longer, unless interest rates decrease, oil prices ease and capital expenditures and personal spending increase, he said.

But other analysts said they disagree. "These fears aren't justified, but it won't stop people from selling in the short term," said Patrick Dunkerley, an analyst at Securities Corporation of Iowa in Cedar Rapids, Iowa.

During this current period of slumping sales, Dunkerley said, it pays to be a buyer and reinvest in other good names such as EMC Corp. in Hopkinton, Mass., and Network Appliance Inc. in Sunnyvale, Calif.

A key development for the PC manufacturers will come this week when IBM reports its earnings. "It could pick up the industry. ... [IBM] is the microcosm of the industry," said Gary Helming, an analyst at Wit SoundView Group Inc. in Stamford, Conn. ▶

MARK HALL

The new IT leader

LIKE MOST *Computerworld* readers, you probably got where you are by proving your technical chops first and your managerial prowess sometime later. Trading war stories about the ins and outs of S/390s, Unix, database schema or network topologies is a good way to stay in

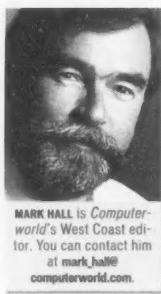

touch with your team.

So it's natural for you to consider the same kinds of skills in others as you promote department managers and even your successor. But that would be a mistake.

This is not to disparage hands-on smarts. Technical talent will always be needed. The lack of it has set back important corporate business objectives, directly hurting the bottom-line performance of too many organizations. But a different brand of IT management savvy is essential in the Internet era. One new skill you should be seeking is outsourcing management.

Like it or not, most of what an IT staff does today will be outsourced in the next three to seven years. Desktop application support. Server management. Software upgrades. Backups. You name it. In the name of the almighty ROI, these classic insider IT tasks are going out the door along with some of your best people who used to do them.

Not so long ago, it was critical to understand not just what a system did, but how. Without knowing how, you couldn't determine whether IT projects had a chance to succeed, whether management was asking for too much or

MARK HALL is *Computerworld's* West Coast editor. You can contact him at mark.hall@computerworld.com.

whether an ambitious developer was overpromising.

Those days are vanishing. It's far more important to find and promote people in IT who understand more about developing relationships between users and outsourced suppliers. The new IT leaders will know instinctively which service provider will do the right job for the right price. They will know whether an SLA is right for the user, how much IT needs to supervise the relationship or whether to simply let the end user do it on his own.

This week's cover story by Gary H. Anthes (see page 80) reveals the many ways in which poorly chosen application service providers can undermine IT objectives. His report points to a need for IT to groom new managers who understand more about constructing business relationships than they do about cool new features in Windows 2000.

The good news amid the bad in Anthes' story is that CIOs increasingly understand that they need to develop outsourcing managers as much as, say, Java programmers. The war stories won't be the same, but the bottom-line value to the company will be better. ▀

DON TENNANT

At long last, 3Com makes the right choice

SPUTTER. SPUTTER-SPUTTER. Look! 3Com is going to crash and burn! No, wait! It's coming out of the tailspin! It's going to make it!

That was close! Good thing 3Com finally had the sense to replace the pilot. The last thing we need is another IT vendor that becomes an acquisition target due to an inability to compete.

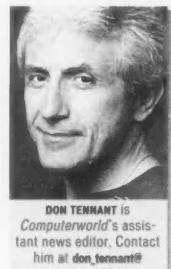

That's exactly what stood to happen if longtime CEO Eric Benhamou had not announced last month that he will eject on Jan. 1 so Bruce Clafin can take over. And the timing was impeccable.

Benhamou's descent came as 3Com announced its results for the quarter that ended Sept. 1. The company managed to put a positive spin on the fact that it suffered a net loss of \$41.3 million, only because it had taken a *real* dive the previous quarter, when it lost \$163.7 million. That enabled 3Com's public relations flack to say with a straight face that Benhamou was "not making this transition when 3Com is in trouble and is headed in the wrong direction." When you consider that for the same quarter last year the company actually made quite a bit of money — \$113.6 million and change — it's a stretch to contend that the company was out of trouble when Benhamou announced his exit.

I never thought Benhamou had any business sitting in the pilot's seat in the first place. I remember interviewing him eight years ago and being tremendously entertained by the fact that his idea of an interview was showing me a PowerPoint presentation about his company. What kind of a CEO needs to rely on a bunch of PowerPoint slides to convey his thoughts? The same kind of CEO, perhaps, who would abandon his big enterprise users by exiting that market after those same users spent lots of money, which in turn enabled 3Com to report figures way up in the black — \$506.3 million in net income. That's what Benhamou did in March.

But 3Com can't be faulted too harshly for the timing of the change at the top. Although Clafin should have become CEO when he was brought on board in July 1998 as president and chief operating officer, at least 3Com didn't wait until it was too late. That's the fatal mistake Digital Equipment made.

Before he made the move to 3Com, Clafin was

SPECIAL ADVERTISING SUPPLEMENT

SNIA
Storage Networking Industry Association

The mission of the Storage Networking Industry Association (SNIA) is to promote the use of highly evolved, widely accepted storage network systems across the IT community – efficient, interoperable systems that meet the needs of today's organizations and can cope with the projected requirements of future applications. This Storage Industry Directory & Buyer's Guide is intended to be the industry's most comprehensive listing of the major participants in this burgeoning market.

The SNIA's relationship with Computerworld is providing an awareness of and access to the latest information on storage networking and advanced storage technologies to IT users and vendors. Our collective vision is to become the leading source of information, education and guidance for the industry by promoting the evolution and acceptance of industry standards among vendors, implementers and users. We endeavor to accomplish this by producing the highest-quality industry conference with our twice-annual Storage Networking World® featuring an unparalleled Interoperability Lab program as well as producing a comprehensive series of topical White Papers.

This Storage Industry Directory & Buyer's Guide is yet another important component of our integrated industry information offering. I invite you to explore and consider the expertise, resources and storage solutions provided by the companies listed and profiled in this publication.

Regards,

Larry Krantz
Chairman, Board of Directors
Storage Networking Industry Association

The storage market is exploding like never before! The total worldwide systems market will surge to \$46.3 billion in 2003, driven primarily by networked storage.

For companies that hope to gain the advantages of storage-area network solutions, the next great challenge is communication and the ability to identify components of integrated solutions, quality service providers and implementers as well as suppliers of technologies that will both interoperate and meet future storage-user demands. Companies and organizations will make investments in storage systems for a variety of reasons, all of which can be mapped to three basic business objectives: to increase revenue, decrease expense and reduce risk.

With the information provided in this unique Storage Industry Directory & Buyer's Guide, storage-solution-seekers will find a ready group of companies poised to address their demands. IDC is proud to be a leader in analyzing and educating the storage market. We are similarly pleased to be a sponsor of this important industry directory.

Regards,

John T. McArthur
Vice President, Worldwide Storage Research
IDC

COMPUTERWORLD ENTERPRISE BUSINESS SOLUTIONS

This Storage Industry Directory & Buyer's Guide was created and assembled as a custom published Supplement to Computerworld by the Computerworld Enterprise Business Solutions unit in conjunction with the Storage Networking Industry Association (SNIA). It is intended to be an annual publication and a key part of the storage market initiatives resulting from Computerworld's unique strategic alliance with the SNIA. Computerworld acknowledges and thanks International Data Corp. (IDC) for its sponsorship of this endeavor. We also say thank you to our advertisers in this supplement.

Company listings were compiled from an industry survey conducted by Computerworld's Enterprise Business Solutions unit together with association member companies supplied by the SNIA. Companies listed with a profile and their logo paid a small fee for this upgraded listing – all listed companies were offered this option. The information presented in these profiles, including the designation of the Storage Products and Services marketed by them (see below) and their contacts, was provided directly by the companies themselves. Computerworld, the SNIA and IDC are not responsible for the accuracy of the information provided.

New ARCserve® 2000 Offers Serverless Backup And Restore Plus Hundreds Of Other Enhancements.

It couldn't have come at a better time. With eBusiness storage needs typically doubling every 18 months, and the growing demand for 100% uptime and availability of servers, IT administrators are facing ever-greater challenges.

New ARCserve 2000 is the answer. With serverless backup and restore, ARCserve 2000 represents a major breakthrough in data storage. With SAN, there are

many new industry-leading capabilities like shared tape libraries and high-speed data transfer.

ARCserve 2000 leverages industry standards for assured compatibility with high performance, ease-of-use, and unprecedented value. Just a few of the reasons why new ARCserve 2000 is the best storage solution for the eBusiness revolution.

Visit www.ca.com/arcserve for more information.

Emulex Corporation manufactures fibre channel host bus adapters and digital retiming hubs. Emulex's LightPulse family of products support all fibre channel standards, including arbitrated loop, switched fabric and point-to-point topologies. (SNL,DM)

what are you waiting for?

**Don't wait for unnecessary data transfers:
Share your files with a SAN solution from Ciprico.**

Time is money, especially for companies like yours that depend on **visual image computing**. Don't waste either one with inefficient, unnecessary file transfers.

Now you can maximize production time. Speed your operation's workflow. And increase your revenue potential with Ciprico's totally **integrated SAN solutions**.

Ciprico offers a **superior** line of open storage solutions that are fast, reliable, and easy to install. Our products are designed for **direct attached** and **networked environments**.

You want it, we got it:

- **7000 Series Disk Array** for high bandwidth, single stream applications
- **FibreSTORE Family of Storage Systems** for high bandwidth, multistream applications
- **NETarray Storage Systems** for high I/O applications

Visit our web site at www.ciprico.com to see how we help visual imaging companies maximize their capabilities by **streamlining project workflow**. Or call 1.800.727.4669

Something SUPER

is happening with DLTtape!

The demand for storage is exploding and the need for fast, reliable storage has never been greater. Today, nearly 75 percent of the midrange tape storage is on DLTtape, the industry standard.

That standard is being extended with Super DLTtape,[™] offering dramatically higher storage capacity and faster transfer rates, all with a lower overall cost of ownership.

Learn more about DLTtape and Super DLTtape by calling 1-800-624-5545, or visit us at www.DLTtape.com

ARE YOU BEING
held hostage
BY YOUR STORAGE NEEDS?

Presenting SAN.

Storage Area Networks. The Network Behind the Server.

Tired of running around your company collecting backup tapes? Cringe at the thought of how your users react when they can't get to the data they want? Let's face it, with the non-stop growth of data and the increasing need for continuous data availability, your job is not going to get any easier.

Fortunately, there's SAN. By enabling new storage management solutions, like LAN-free backup, SANs can release you from the shackles imposed by the booming growth in data storage.

LAN-free backup provides centralized, multi-server backup that moves backup traffic from the LAN to the SAN to reduce LAN congestion and the effects of backup window downtime. And with Gadzoox SAN products, you'll be set free in no time, since our hubs, switches and routers are certified with all of the major backup applications. With scalability to support gigabytes to terabytes, there's no job too large or small for our SAN solutions.

To learn more about how SANs can help solve your storage management, disaster tolerance and server clustering needs, visit www.gadzoox.com/backup or contact Gadzoox sales at 1-888-391-7360. The sooner you do, the sooner you can set your entire organization free.

StorageNetworks
Storage Services for the e-Economy

Neither your competition nor new market opportunities will wait for you to add data storage capacity, hire the right people to productively employ that data, or to complete data backup and restore. That's why StorageNetworks™ provides an on-demand data storage infrastructure, network and software solutions that ensure secure, scalable and accessible data storage, and, of course, the expertise to make it all come together. This way, we save you from the distracting and costly task of storing, protecting and managing your data. In fact, we do this better and more cost-effectively than you ever could yourself. Allowing you to focus on leveraging your information and honing your competitive edge. To learn more about our secure, scalable, "easy-to-access" approach to data storage, visit us at www.STORAGENETWORKS.com.

OPEN SYSTEMS & SOLUTION ORIENTED SAN TRAINING

Infinity I/O is offering the industry's 1st Open Systems SAN Certification Program, providing clients greater assurance of Fibre Channel and SAN skill sets.

Infinity I/O is the world leader in Fibre Channel & SAN training and is dedicated to being your one-stop shop for all your Storage Networking educational needs, by providing the highest quality courseware available. Since 1995, **Infinity I/O** has been offering a wide variety of courses designed to educate the marketplace about Storage Networking technology and the successful management of information logistics. The **Infinity I/O** approach is a systems level training focused on a best practices methodology to building an effective information infrastructure. Rather than offering just one topology, just one protocol or just one company's products, we offer your organization the premier education program in Open Systems, Solution Oriented SAN. We have trained over 7500 Fibre Channel and SAN professionals worldwide.

Fibre Channel

The Connection is Critical.

©2000 QLogic Corporation. All rights reserved. All trademarks and registered trademarks are the property of their respective holders.

Need to ensure SAN Interoperability?
With QLogic, there
are NO WRONG answers.

Choose the Fibre Channel adapters proven to interoperate throughout the SAN. Today's heterogeneous SAN environments demand interoperability. QLogic's Fibre Channel products are designed to perform harmoniously with a broad range of software and hardware. Interoperability is engineered into QLogic's unique single chip solution and ultra-scalable architecture, making QLogic's Fibre Channel solutions the easiest to implement and evolve. Install a QLogic board and it works. It's not magic - just the result of years of exacting design and diligent testing. It's why QLogic sells more Fibre Channel adapters than anyone in the industry and what will put your mind at ease.

The Connection is Critical.

Anywhere, Anytime Customers Need Access To Your Data

Because you are expected to provide continuous application availability, Troika Networks' Dynamic Multipathing is the solution for you. It handles environments as diverse as departments to data centers. TROIKA remarkably simplifies administration and correspondingly lowers cost of achieving continuous application availability – because there is no need for complex components to be managed. The Zentai™ Controller revolutionizes access to storage data by using all available paths to a storage device, including tape devices, JBODs and RAID.

To learn more about what Dynamic Multipathing can do for you, visit www.TroikaNetworks.com for white papers and product information.

TROIKA™

The Zentai™ Controller and Management Software provides essential elements for designing and building server and storage area networks. TROIKA pioneered the use of three protocols in one PCI-to-Fibre Channel controller: SCSI for storage, IP for storage network functions like backup, and VI for server-to-server.

**Introducing a smarter
way to manage critical
business information**

Proactive Network Storage Solutions™

And introducing StorageApps...
the only company offering this
innovative approach that lets
you put your information to work.
Today. Everyday. Not someday.

We've been providing advanced
storage solutions to the most
demanding global customers
for years. And many of those
customers are now members
of the StorageApps team,
sharpening our insight into real-
world issues. So we understand
the challenges you face. And
we understand good products
don't equal a complete solution
if they can't work together. So
we took a smarter approach.

Our Proactive Network Storage
Solutions build intelligence into
your IT infrastructure so you
can plan, organize, direct and
monitor business information
across all your systems, servers
and storage devices.

The flagship of this approach is
SANLink™, powered by SAN.OS™
and SANSuite™. It's a complete
solution that provides any-to-any
connectivity, business continuity,
lights-out management,
optimum security, and 24x7
service and support.

**Interested in putting your
information to work? Let us
introduce ourselves to you. Visit

NEWSOPINION

CEO Robert Palmer's No. 2 at Digital, heading worldwide sales and marketing. I met with both Claflin and Palmer about a year before Compaq's 1998 acquisition of Digital and came away convinced that Palmer would have the decency and good sense to step down so that the much more capable Claflin could take over. I was wrong. Claflin should have been named CEO the moment he joined the company after 22 years at IBM. But what really hurt is that Digital didn't correct that mistake in time. Fortunately for 3Com's users and investors, it did. ▶

ALAN PALLER

Visa leads charge for better Web security

IMAGINE BOARDING an airplane knowing that no one is absolutely sure how to check its airworthiness and safety, and not knowing whether the people who checked your plane were qualified in any way. That's the world in which the vast majority of Internet-connected computer users live today.

Internet-connected computers are at risk. And it's clear that anyone who does business on the Net is vulnerable. Corrections, defenses or patches exist for most flaws, but when they're not installed, the systems are vulnerable and attacks succeed.

A key element that's missing in Internet security is a set of practical, widely accepted and non-proprietary operating standards specifying *in detail* how systems should be configured and operated. Such cybersecurity standards would be similar to the maintenance and preflight action standards that every airline uses and every passenger has a right to demand.

Without widely accepted standards, organizations will continue to install computers blindly, hoping they'll be protected by obscurity or luck. If the global economy weren't dependent on the Internet, such wishful thinking might be acceptable. But today, every unprotected system connected to a high-speed communications line is a loaded weapon that attackers can use against e-commerce leaders, communications and power companies, and national governments.

Of even greater risk for e-commerce is a business partner that doesn't protect its systems, thus putting every other electronic partner at risk. It isn't surprising, then, that Visa, the firm that stepped forward to begin solving the problem, is

connected to a very large number of other companies. Visa processes \$1.7 trillion in transactions every year, or more than \$4 billion every day. To do that efficiently, Visa electronically partners with 21,000 merchants that carry its logo.

In late July, Visa issued a new set of 10 requirements that each merchant partner must meet if it wants to keep the logo. They range from having specific firewall settings to changing default passwords, and they cover patches, encryption, antivirus software and more. What makes Visa's "Ten Commandments" so valuable is that they're practical. Most organizations that understand security already comply with them. Visa's great contribution is bringing the security neophytes up to a safety level comparable to that of security-savvy organizations.

Visa has provided the Internet community with an effective starting point for creating the global standards on which Internet safety can be built, but there are still significant tasks to be completed. Visa's starting point must be broadened to encompass the new security requirements being established by law (such as in the Health Informa-

tion Portability and Accountability Act of 1996) and those followed by auditing and international standards organizations.

To accomplish that, representatives of dozens of federal, state and local government agencies are working with academics and corporations (led by representatives of Visa and Merrill Lynch) to convert the Visa effort into one global set of standards.

Their not-for-profit organization (which my organization also helped form) is called the Center for Internet Security. Every organization that wants improved Internet safety can help make the center's efforts successful by participating in the process of shaping the standards, ensuring that every deployed system has been made safer in accordance with the standards and ensuring that those settings have been validated by someone who has been certified to test compliance.

There can be no confidence in the Internet's reliability without broad-based security. It's time to stop whining about the lack of security and start ensuring that every system of every business partner meets at least minimum safety standards. ▶

READERS' LETTERS

Protected payment

CONSUMERS should be wary of using new forms of payments ["Older Systems Hinder E-Payments," Page One, Sept. 25]. There are a great many legal protections for payment by check or credit card that don't exist for new forms of payment.

In addition, standard business and legal practices already exist for these older forms of payment. If proof of payment is required, a canceled check or signed credit card receipt is acceptable to a business or a court.

though a few of the attacks succeeded in altering Web pages, no significant damage was done. That's a very complacent view that is based on the fallacy that attacks that aim to alter Web pages are the only significant ones. The truly malevolent hacker will take care to hide his tracks, by means including the planting of executables that replace system executables.

Respect the contract

IN THE column "Message to ASPs: Regulate or Be Regulated" [News Opinion, Oct. 2], Barbara Myles draws illogical conclusions and false facts from an isolated case.

To state that Pandemic's customers couldn't include language in their service-level agreements (SLA) to cover the costs of moving data is just naive. Had the SLAs been violated, causing customers damage, there

is nothing stopping them from attempting to get relief from Pandemic's corporate parents, Intel and SAP.

But to say that regulation is needed and that if the ASPs themselves don't do it, the feds will step in, is sheer lunacy. Governmental bodies have no business interfering with what amounts to a legitimate contractual arrangement between companies. If companies aren't smart enough to protect their assets, intangible or otherwise, they deserve what they get when things go wrong.

Hard to take Microsoft's move at face value

IN READING "Maritz Resigns From Microsoft" [Computerworld.com, Sept. 14], I was struck that Vice President Paul Maritz will continue to work as a consultant to Microsoft on strategic and business issues. It makes me wonder whether the recent rash of resignations and retirements of people still working for/with Microsoft, now on a private/consulting basis, is just a way for the company to avoid regulations that apply only to permanent or in-house em-

ployees. Considering how much of the recent trouble it has been having is tied, for instance, to company e-mails, I begin to wonder if they're now outside the system so that they can claim more privacy rights and erase data and e-mails they wouldn't be allowed to if they were still in-house.

Paranoid? Maybe, but I have too much experience with Microsoft to trust anything it does at face value.

Carl Dershem
San Diego

Don't fall into the Web development speed trap

THE POEM "The Charge of the Light Brigade" describes an intrepid British cavalry unit that bravely rushed headlong to its own destruction. When it comes to e-commerce, many IT departments are following suit. While one must applaud their zeal and expediency, many are moving at light speed into an ambush — with potentially fatal results.

Speed itself isn't the problem. The danger arises from how companies are reaching that speed. Many are turning to strategic partners such as Web application server vendors and managed

hosting services whose offerings promise to significantly accelerate time-to-market by eliminating the time and expense of developing e-commerce infrastructure in-house.

Unfortunately, there's a big price to be paid for this kind of fast-lane living. Sure, using one of today's sophisticated, pre-fabricated Web application server environments enables you to avoid a lot of the infrastructure development hassles that you'd encounter if you had to design all of your own database connectivity, object models and fail-over mechanisms from scratch. But the speed these vendors are selling is as addictive as what drug dealers peddle on the street.

Here's what tends to happen: An IT department gets major time-to-market pressures to roll out a new e-commerce offering. In order to make the deadline, it selects an application server vendor that can provide a lot of ready-made technology. But to take advantage of this bells-and-whistles application server, the department has to implement the company's e-commerce business logic using scripts, "wrappers" and/or other development components that are highly vendor-specific. If it works, it does the same thing again and again. Within a few months, all its critical business logic is firmly encased in a highly proprietary development environment. Voilà! Vendor lock-in!

What's particularly ironic about this phenomenon is that the Web was supposed to be the place where we were going to use pure standards — such as HTML, Java and XML — to avoid the proprietary quicksand of previous development environments. But in our rush to market, it seems we're willing to trade long-term openness for short-term business results.

There are some solutions to this problem be-

sides avoiding application servers altogether. One is to choose your server based on the kind of exit strategy it provides rather than just going for maximum features. Another is the emergence of standards, such as Enterprise JavaBeans, which would make it easier to migrate software components from one application server to another.

But the most important solution may be to re-evaluate our obsession with pure speed and our overemphasis on being "first to market." As the honeymoon ends for many first-wave dot-coms, we're seeing that being first to market may simply be the first to fail. The right business model, a strong customer focus and flexible technology are more vital to profitability and growth than a press release with the word "first" in it. The race, as the Bible says, is not always to the swift.

So beware of the speed merchants — unless you really want someone to write a poem about your e-development brigade's valiant, senseless death at an early age. ▶

WILLIAM M. ULRICH

The CIO has a new role for a new era

THE FACE OF information technology is changing. Business units, outsourcing vendors, application service providers (ASPs) and supply chain, electronic-market and other consortia have taken over many tasks that have traditionally fallen within IT. Dispensing the management of these functions has resulted in greater flexibility in deploying business-driven solutions, but it has also reduced IT's ability to standardize, streamline and coordinate IT-related functions.

This distribution of IT roles and responsibilities has also diminished the CIO's ability to impose policies and dictate results. Yet the CIO must still find ways to enable key business initiatives through the effective and efficient use of technology.

Outsourcing and ASP vendors, distributed e-business initiatives and third-party consortia are here to stay, essentially ending the reigns of monolithic IT organizations at which CIOs had complete control over all information-management functions. But these new dynamics have given rise to fragmented initiatives that are poorly coordinated. Left unchecked, that fragmentation will escalate. To alleviate this situation, top-down command-and-control mod-

els must be replaced with organizing philosophies that facilitate communication, collaboration and adaptability.

The CIO is best suited to lead the enterprise into this new era. More than other top-level executives, he understands IT and how it enables business strategy. I have spoken with CIOs who understand the challenge of bridging the gap between business requirements and the ability to deliver solutions to fulfill those requirements in a timely manner. The CIO must be able to influence and inspire internal and external business units to work toward a common goal in a coordinated fashion. This requires the CIO to be a leader in developing a clear vision for IT and motivate executives and all employees to pursue this vision.

As part of IT's transformation into a collaborative organization, the CIO should strive to reshape IT so that distributed functions can be coordinated under a common information-management infrastructure. This requires bringing IT, business units and external business partners together to collaborate, share ideas and self-organize to accommodate ongoing change. The self-organizing aspect allows technical and business units to form working teams without reorganizing from the top down each time. The CIO, in tackling such an initiative, would demonstrate leadership by sacrificing command authority to create a more effective IT organization. In other words, decisions will be delegated to units performing the tasks associated with those decisions.

Here are three steps the CIO should take in transforming the IT organization:

1. Determine how information is processed and managed. The CIO and a cross section of business and IT representatives should convene focus groups with each business and technology unit that performs IT-related functions. This should include any third parties contracted to perform IT tasks. The findings establish a basis for the next steps, which include selling management on the need to transform the IT organization.
2. Work with a comprehensive cross section of business and IT representatives to develop a vision for the new IT organization. This new organization builds upon existing strengths while eliminating the bureaucracy that inhibits or discourages communication and collaboration. As part of the transition to this new organization, the CIO works with all relevant parties to define the purpose and principles that bind participants under a common organizational framework.
3. Finally, create an IT "constitution" that defines each group's purpose, role and relationship with other groups. In the new organization, the CIO has no direct reports but convenes a working council of representatives from each major functional area. As council chairman, the CIO becomes a strategist, motivator, collaborator and leader.

The CIO is in a unique position to deliver business strategies through IT. Change is always difficult, but a strong CIO will have the leadership qualities needed to steer the enterprise through these dynamic times. It's time the CIO leads the effort to reinvent IT — and the CIO's role — along the way. ▶

COMPUTERWORLD
BOOKS FOR IT LEADERS

You don't have
to be company's

The bridge between the paper world and

Your investment in IT infrastructure is huge. And the impact of the Internet on your IT budget grows larger every day. You've poured tons of resources into ERP systems as well as e-mail and document workflow systems. How much? Well, studies show that as much as 50% of an average IT budget can be involved with managing documents.

True, there are more documents online than ever before. But it's also true that we are creating more paper documents than ever before: twice as many as just five years ago. The reason is simple: Most companies have lots of off-ramps that turn electronic documents into paper documents, but almost no one has lots of on-ramps capable of converting paper documents into electronic ones.

In fact, giving you new ways to leverage your IT investment by bridging the frustrating gap between the paper world and the electronic world is exactly what the Xerox Document Centre system was designed to do.

It's about document imaging for every workgroup.

If scanning is on your radar at all, you probably see it as limited to environments with dedicated operators. And so it has been. But the Document Centre system is changing that in big ways.

For starters, a Document Centre lets people work the way they are used to working—you can scan documents in the same place you print or copy them—it's that easy and that accessible. Of course, the Document Centre gives workgroups of 10 or more desktop control over everyday functions like printing, copying, PC faxing and finishing. What's more, by making document imaging an "everyday" function, the knowledge and information recorded in paper documents can now become a seamless part of the digital workflow.

XEROX DOCUMENT CENTRE

Print

the online world is now open for business.

Scan directly to the Web or virtually anywhere else you want to.

Going out to the hallway and scanning large documents into the digital stream at up to 65 ppm is certainly efficient, but the important question remains: Where is all that information going, and what can you do with it once it gets there?

Document Centre lets you scan directly to industry-standard messaging and collaboration platforms

like Microsoft Exchange, Lotus Notes or Domino.Doc.

You can scan directly to a Web repository, so anyone has instant access to information from a remote location.

Scan to your PC desktop, and with ScanSoft PaperPort and TextBridge software bundled with Document Centre, you can drag and drop your scanned image into any one of 150 industry-standard applications. You won't need to re-key your documents.

Scan 65 ppm

3 easy steps

- 1 Select scan folder
- 2 Select destination
- 3 Press green button

Or scan documents to the network, and using software like Xerox DocuShare, users can access them through any current Web browser on any platform. It gives you an electronic file cabinet that's a very efficient way to share knowledge and dramatically reduces e-mail traffic.

Or combine Document Centre with Xerox FlowPort. FlowPort is a Web-based software platform that

manages the flow of documents from paper to digital and back again in dramatically new ways. For example, FlowPort gives mobile workers the freedom to access and print any documents on the Web without using a PC.

And when it comes to getting your digital documents back into paper form, Document Centre's open architecture supports all major industry printing standards and encourages third-party software solutions to thrive. So you can print not only from your desktop or from the Web, but also directly from your mainframe, including ERP applications like SAP.

In short, things once limited to paper are electronically archived, accessed, shared and easily printed wherever you need them. It doesn't just increase productivity, it decreases costs and saves time. Turn the page to learn how one of our customers is already benefiting.

Paper or digital, it's about solutions that leverage the network.

We have hundreds of customers who report impressive results. But here's one in-depth story of how a Document Centre solution reduced one organization's work-cycle time from three days to just three minutes.

The Customer:

Center for Technology Management, in a prominent Midwestern research institute.

The Problem:

There are dozens of huge file cabinets overflowing with documents—patents, notes and contracts about inventions the university owns. Each year up to 1,500 new folders are added. Every day, dozens of people call and request files. By law, the university must provide public access to any of these thousands of complex scientific documents for reference, revision, notation or collaboration. And it must be done for 25 years. The commitment of time, space and personnel is large and growing.

The Solution:

Combine Xerox FlowPort and DocuShare with two Document Centres. This gives you a search engine for all your documents.

Now when people need a document, they just check off the file they need on a FlowPort cover sheet, scan it into the Document Centre, and FlowPort software finds and sends the requested electronic file to a server that can print, e-mail or store the document. What's more, once the file is stored, DocuShare lets you manage it on the Web, giving authorized users instant access for viewing, downloading and printing documents from anywhere at any time.

The Result:

A process that used to take three days can now be completed instantaneously. Documents are accessed and shared electronically. Paper is eliminated while collaborative work processes are made simpler. Security is improved. Those 20 file cabinets are soon history. Costs are lowered. Time is saved.

Online or off, it's about a simpler way to share knowledge.

In a world of intranets and extranets, of e-commerce and the Internet, you need state-of-the-art technology and expertise to manage and share the documents that contain the knowledge in your organization. The Xerox Document Centre is a digital platform engineered from the ground up to eliminate the barriers between your paper and online documents. Call us or visit our Web site for more information. And see how much you can increase productivity and control cost just by getting all your company's documents online.

READERS' LETTERS

Tuition plan is in order

AFTER SIX months and a few thousand dollars in tuition spent to learn the fundamentals of client/server computing — in my case, PowerBuilder and Oracle — I had hopes of getting my foot in the door with at least some type of entry-level position, low salary and all. I have nearly 30 years of mainframe programming background, but apparently, even employers in rural areas are holding out for people with years of experience in the current technologies.

If employers refuse to hire U.S. citizens because of their lack of experience and insist on foreign workers, they should be required to fund some type of tuition relief for Americans who are returning to school to learn new skills and to subsequently use them in the workplace.

Carnivore review process undermines privacy rights

THE GOVERNMENT will do all in its power to keep Carnivore secret and try to divert the review so that the people will never know if our freedom to privacy is being violated [“Government Errors Exposes Carnivore Investigators; ACLU Blasts Team for Close Ties to Administration,” Computerworld.com, Oct. 5]. I find it disgusting that truly independent people were not chosen to review Carnivore. And I believe that Congress and the courts are our only avenue to stop the government from being able to look into the people’s private mail.

Russell B. Sharpe
Manager, support services
Saudi Operation & Maintenance Co.
Saudi Arabia

DID ANYONE really expect a thorough, truthful and accurate review? Congress has apparently shelved (read, “given up on”) seriously considering any privacy legislation for at least the

next 18 months, so why worry?

I hope all netizens carefully read the Wen Ho Lee interrogation transcript. It’ll give everyone who’s ever sent an e-mail some indication of what to expect when Carnivore gets hold of their communications.

Andrew Gettler
Dhahran, Saudi Arabia

ANYONE WHO doesn’t have top-secret clearance wouldn’t have a clue how to evaluate Carnivore. Anyone who does have top-secret clearance is compromised. Who are they going to pick? Santa Claus?

Ben Burrows
Princeton, N.J.

BellSouth has a glitch, too

ACCORDING TO “Glitch at Amazon.com Exposes E-Mail Addresses” [News, Sept. 11], the company’s “Associates” were shown the e-mail addresses of other associates.

I have seen an even worse glitch on BellSouth’s Web site. When attempting to view previous months’ phone bills, I was shown not my phone bills, but those of other BellSouth customers, including details of long-distance calls. I e-mailed BellSouth about this but received no response.

Paul Hammond
Huntsville, Ala.

The right .dir-ection

NOVELL’S proposal for a “.dir” Top Level Domain [“Novell Proposes .dir Domain for Directories,” Computerworld.com, Oct. 6] makes a lot of sense to me. It is both a practical and elegant solution. The alternatives identified in the article (from Sun Microsystems and Alice’s Registry) have major drawbacks, and partial implementation has proved to be problematic in the current environment.

The concept that the proposal should be rejected because it subverts the Internet “for commercial purposes” is ludicrous. Come on; business people are people, too. They have a right to ask for things

work more efficiently and conveniently. Novell’s idea does just that. It may not be a big idea, but it does make sense, and ICANN should go for it.

Arthur Gregory

Dhahran, Saudi Arabia

Strange justice

IF MICROSOFT were truly not guilty, it would be appalling that its appeal was not accepted immediately by the Supreme Court so it could be exonerated quickly [“Microsoft Seeks Five Months for Appeals Filings,” Computerworld.com, Oct. 6]. It has shown a clear understanding of “justice delayed is justice denied.”

Charles J. Lingo
Ponchatoula, La.

All fun and games

OH, THANKS a lot, Computerworld, for that QuickStudy on “Easter Eggs” [Technology, Sept. 18]. What, do you suppose, will be the total loss of productivity to businesses around the world as Computerworld readers — and all their friends — play Microsoft Word pinball or fly around inside a spreadsheet trying to find the Excel monolith?

Now that I’ve found the monolith, I had best be getting back to work (just as soon as I e-mail my girlfriend about this). By the way, that pinball game was pathetic!

Jack Kaufman
Senior programmer/analyst
Binghamton, N.Y.

Power for the people

MY BROTHER is an excellent professional truck driver with probably the most difficult driving job in existence: the delivery, without a scratch, of new cars. He’s always learning more about how to do his job better. He’d be interested to know of Shawn Button’s theories [Readers’ Letters, Sept. 11] that he’s a mediocrity who owes his position to seniority. The myth that unions are interested only in seniority in place of real skills needs to be laid to rest.

First of all, many union-free data processing shops use seniority in assigning pay and benefits. Lazy personnel practices are alive and well in nonunion companies, especially in more conservative industries. Second, the irrationality of using age appears in many cutting-edge environments in a new form: reverse seniority, in which younger employees are permitted and encouraged to disrupt good practices, at times for the sheer hell of it. Thus, expertise in Visual Basic is thrown overboard because those experts are represented as old fuddy-duddies by media propaganda.

But having said this, I am not convinced that programmers need unions, and I am less convinced that managers like Mr. Button should be in unions. This is because, since 1948, U.S. businesses have enforced, by means of the Taft-Hartley Act, the idea that collective bargaining must restrict itself to pay and benefits. “Management prerogatives” in U.S. workplaces mean that work rules and control of the workplace must, in our society, remain in the hands of management.

The problem is that in a real sense, programmers enforce the actual rules. We need instead to decide that workplaces are not fully private property but that the community, including managers, programmers and union truck drivers, should have a say in the way business is conducted.

No offense taken

IN THE Oct. 2 issue, Christine Wagner wonders “if male readers would be offended seeing a man in a

G-string selling a router” [Readers’ Letters]. This male reader certainly wouldn’t; when may I expect the first ad? Paul Hardy wonders if sex sells managed hosting solutions. Maybe not, but it might make a dry newspaper a little more fun. And it did get his attention.

Stan Kerr
Computing
& Communications Services
University of Illinois
Urbana-Champaign
stankerr@uiuc.edu

I WOULD LOVE to see a picture of a man in a G-string selling routers, and I hope Computerworld will find an advertiser willing to strike that blow for equal opportunity. For an appropriate fee, I’d pose for the ad myself.

Terry Duke
El Paso, Texas

READERS WHO objected to the DataReturn/Victoria’s Secret advertisement have a right to their opinions, but Computerworld’s policy seems perfectly sound. Victoria’s Secret is a well-respected, ethical retailer. DataReturn was promoting its success in supporting that retailer’s Internet marketing efforts. The picture in the advertisement was relevant and in perfectly good taste. You honored your obligation not to censor legitimate advertising. As to Ms. Wagner’s question: This male might be bored or amused by “seeing a man in a G-string selling a router,” but certainly not offended.

Tile Maker Looks to Web for Lifesaving Jolt

Analysts cast doubts on online strategy

BY TODD R. WEISS

Faced with two years of rough financial performances and tough times in its key flooring and ceiling tile markets, Armstrong World Industries Inc. is hoping the Internet will help improve its health.

The 140-year-old company has spent this year putting together a new Web strategy to help cut production costs, improve its market share and expand its customer base. But

analysts say the Web isn't likely to rescue Lancaster, Pa.-based Armstrong from financial woes.

The problem, said Chris Winham, a financial analyst at The Goldman Sachs Group Inc. in New York, is

that Armstrong is "the market leader in a low-growth or no-growth industry — that being vinyl flooring."

Armstrong's financial struggles have shoved its stock into a free fall, plunging from an all-time high of \$90 per share in April 1998 to \$5.63 per share on Oct. 6. But despite what critics say, the company is determined to use the Internet to reverse that trend.

"We look at [the Internet] as one of the very best opportunities we have to help drive our top lines," said Frank Riddick III, Armstrong's president and chief operating officer.

Beyond changing its Web site, which was launched in 1994, the company is incorporating several core components into its new e-commerce approach, Riddick said.

Armstrong is participating in online marketplaces such as Pittsburgh-based FreeMarkets Inc.'s FreeMarkets.com to buy raw materials at lower prices. In addition, the company has merged its 30 global and departmental Web sites into one, giving visitors a central place to visit and learn about its products.

The company said it also

hopes to expand its market by targeting younger shoppers. In researching its Web strategy, the company learned that the Armstrong brand name wasn't well recognized by people younger than 35.

More detailed product specifications will be available to encourage home builders and architects to use Armstrong products. There will also be new tools for professionals to acquire the company's products through competitive bidding marketplaces on industry-connected channels.

"We do see this as a major opportunity for us," said Chakib Boudary, the company's vice president of electronic business transformation.

Armstrong has invested at least \$8 million in its Web site this year, hiring Proxicom Inc. in Reston, Va., to help create

and maintain the new site.

The company has also allied with other companies online, including Redwood City, Calif.-based ImproveNet Inc. Armstrong has a banner link at ImproveNet.com, where consumers can get information on home-improvement projects. The link brings about 500 to 700 visitors directly to Armstrong's site each day.

Laurie Orlov, an analyst at Forrester Research Inc. in Cambridge, Mass., said older firms such as Armstrong can "transform" their businesses using well-implemented Web strategies, but the efforts must be well-synchronized with existing sales and marketing channels to be successful.

Freepoint, Maine-based retailer L.L. Bean Inc. was able to use the Internet to find a whole new market with

younger consumers who prefer to shop online rather than with its catalogs, Orlov said. "There's no reason that Armstrong can't do the same thing," she said.

However, Winham said, putting money into the Inter-

bottom line as a result of using the Web.

Margaret Whelan, a financial analyst at UBS Warburg LLC in New York, said companies don't typically get the leverage they expect from an increased Internet presence.

ARMSTRONG WORLD INDUSTRIES headquarters in Lancaster, Pa.

net is "not on the top 10 list of investment drivers in this industry." He added that beyond cost savings, it's difficult to see real benefits to Armstrong's

"I don't think it's the catalyst Armstrong needs to jump-start the company out of the downturn — the funk — it's in right now," Whelan said. ▀

PIMM FOX/VOICE FROM THE VALLEY

Military precision

ARE YOU DOING 10 THINGS at once? If so, you understand how simply scheduling the workday has become a modern business nightmare. So imagine running a major call center, where organizing the schedules of dozens of workers can literally mean the difference between success or failure. Too many people

manning the phones and you have a money-bleeding situation; too few, and irate customers will make your life hell.

In an army, the parallel situation would be if troop movements, deployments or job rotations were borked up.

Offer Matan, the chief technical officer and co-founder of Blue Pumpkin Software Inc. in Sunnyvale, Calif., worked on just such a problem for the Israeli army and has applied this intelligence to the ubiquitous world of call centers.

"We have 150 agents answering credit union member questions," says Pamela Treischel, call center manager at The Boeing Co. in Tukwila, Wash., and a user of Blue

Pumpkin software.

"We used to use Excel spreadsheets, doing everything by hand," says Treischel. "But with Blue Pumpkin, we were able to use our historical patterns and calls and schedule agents to meet the demand; we're able to set the window." The window of operations, that is.

The business world has turned into a battlefield, where military precision and consistency are essential to retaining customers and delivering service. At Boeing's credit union,

the call center handles queries from 280,000 members.

"Companies need this capability because they need to be more efficient with their manpower and more precise in dealing with customers," says Matan. True enough, but does the Stanford University Ph.D. believe that this kind of intelligent forecasting is the way to solve these scheduling issues?

"You can take into account specific factors such as work rules, lunch breaks and personal vacations," he says. "In addition, this process understands that certain people are good at certain things, and you can schedule for that. You have control."

I wondered how much further Blue Pumpkin could push the envelope of normal call center operations when I encountered Shane Larimore, the operations supervisor at JetBlue Airways

PIMM FOX is Computerworld's West Coast bureau chief. Contact him at pimm.fox@computerworld.com.

Corp. in Salt Lake City.

All of Larimore's 222 call agents telecommute. Yes, using Blue Pumpkin, the reservations agents are scattered about at their homes, armed with keyboards, headsets and dial-up connections.

Larimore, who has been working in call centers for five years, most recently at Southwest Airlines, says, "We can forecast call data on any given week and distribute the information to our agents."

By having agents at home, Kew Gardens, N.Y.-based JetBlue is able to reap the benefits of lower costs and lower agent turnover than those big call centers of major airlines.

The airline, which was started early last year with \$130 million in venture funding, says it's going with "unprecedented use of technology for ease, safety and efficiency." With fares averaging 65% less than the competition (mainly on the East Coast), clearly not all the technology advances are in the air.

So the next time you find yourself overwhelmed by 10 things to do, tackle the mundane tasks first, with precision and care. After all, soldiers without coordinated schedules can't fight, just as call center agents can't help customers. ▀

Navy Deal Sharpens IT Focus

Hiring EDS lets military concentrate on content

BY DAN VERTON

FEW CAPTAINS of industry would point to the federal government as an example of efficiency and ingenuity when it comes to contracting for information technology services. The government is too large, inefficient and beleaguered by red tape to act as a model for anything, or so goes the old argument.

However, things may have changed for the government two weeks ago, when the U.S. Navy awarded Plano, Texas-based Electronic Data Systems Corp. a contract for IT services that has been called the largest and most revolutionary of its kind — inside or outside government.

The five-year, \$6.9 billion Navy/

Marine Corps Intranet (N/MCI) contract, awarded after an 18-month bidding process, is the largest IT outsourcing pact in history. The contract's additional three-year option could boost its value to more than \$9 billion, according to Navy officials.

N/MCI will consolidate more than 200 Navy and Marine Corps networks around the world into single, more cost-efficient and secure network that will be centrally administered and operated by EDS. From Marines in a foxhole to Navy commanders aboard ships or at bases around the world, N/MCI will give more than 350,000 sailors and Marines the ability to do everything from ordering additional supplies and viewing personnel records to coordinating military operations.

The goal, according to senior Navy officials, was to find a way to purchase IT services as the military does utilities such as telephone or electrical service.

When the Navy started researching

N/MCI, it found that it spends about \$1.6 billion per year on IT services. However, once the Navy looked at what it would cost to upgrade and refresh all of its hardware, software and infrastructure on its own, that figure surpassed the \$3 billion-per-year mark.

"Keeping that organization connected is an extremely expensive proposition," said Navy Secretary Richard Danzig. "We realized that by turning it over to the private contractor, we could refresh that technology readily because we could insist on performance guarantees from the contractor."

So the Navy decided to give industry tacit ownership of its entire IT infrastructure, for which it received a monetary credit for all infrastructure that could be used by EDS as part of N/MCI. That credit is expected to bring the Navy's annual cost down to just \$1.2 billion per year, said Danzig.

Although all of the bidders, including Computer Sciences Corp. (CSC) in El Segundo, Calif.; General Dynamics Corp. in Falls Church, Va.; and IBM, offered "strong bids," EDS's offer was deemed to be the best overall value, said Joseph Cipriano, the Navy's program executive officer for N/MCI.

EDS must also meet performance measures established under more than 40 service-level agreements for network performance, latency, security and network downtime, each of which includes incentives and penalties.

For example, performance incentives for keeping the network up and operating correctly could amount to \$400 per seat, or up to \$150 million per year, said Cipriano. "In order to do that, [the contractor] would have to delight everyone with the service, above the levels that

AT A GLANCE Military Mission

Contract: Five years, with three option years

Value: \$6.9 billion (or \$1.2 billion per year); option years could boost total to more than \$9 billion

Current Navy spending on IT: \$1.6 billion per year

Winning vendor: EDS

Goal: To replace more than 200 disparate networks with one seamless network owned and operated by a commercial vendor

Size: When complete, N/MCI will support 350,000 Navy and Marine Corps users at bases in the U.S., Hawaii and Japan, as well as users aboard Navy ships

Benefits: N/MCI will allow the Navy to buy IT services like it buys electricity from utilities; will enhance security by eliminating network back doors and will give the Navy more control over technology standards and a better view of annual IT budget requirements

are normally achieved in commercial practice," he said.

The Navy also included incentives for enhanced security that will be based on the time it takes EDS to determine whether someone is trying to break into the network, the time it takes EDS to respond to that intrusion and how the network is affected by the company's response.

The Navy could also terminate the contract and hand the deal over to either CSC or IBM if it isn't satisfied with EDS's performance.

Olga Grkavac, executive vice president of the Enterprise Solutions Division at the Arlington, Va.-based Information Technology Association of America, said N/MCI is a pure example of commercial best practices at work in the government.

"They took the best practices from the commercial sector and applied it to the Navy," said Grkavac. "And they knew they had to go to the commercial sector for that sort of experience." ▀

SNAPSHOT

Who's Doing the Hiring?

Opportunities will still abound for IT professionals in this year's fourth quarter, according to Menlo Park, Calif.-based RHI Consulting Inc.'s Information Technology Hiring Index. CIOs surveyed said they expect a 21% net increase in IT hiring in the fourth quarter of 2000. The largest hiring increases are expected in the following regions and industries:

REGION	NET INCREASE	INDUSTRY	NET INCREASE
New England	31%	Financial services, insurance and real estate	37%
Pacific	26%	Construction	34%
West South Central	25%	Manufacturing	21%
Mountain	24%	Professional services	21%
West North Central	21%	Retail	21%
Mid-Atlantic	20%	Business services	20%
East North Central	19%	Transportation	20%
East South Central	19%	Wholesale	11%
South Atlantic	12%

Germany Lags in Internet Usage but Gears Up for Boom

BY MARK HALL
KARLSRUHE, GERMANY

Mark Twain labeled the German language "awful," but local

companies that understand its unique complexity will have an edge over foreign competitors that may not be able to adapt to

its daunting syntax and vocabulary in time to compete effectively in Germany's rapidly growing Internet economy.

Matthias Greve, CEO of Web.de, Germany's best-known dot-com, whose portal competes with Yahoo and Lycos

and other Web sites targeting affluent Germans, said he believes that by developing "broad and deep" German-language content and offering unique services to the local population, German firms can beat U.S. companies at capturing online business from speakers of German.

Germany lags behind the U.S. and other members of the European Union in getting its citizens online. International Data Corp. (IDC) in Framingham, Mass., estimates that only 24% of German households are connected to the Web. That's less than half the penetration rates of both the U.S. and the Netherlands.

However, IDC also projects that the percentage of Netizens in Germany's population will more than double to 51% in three years. That increase is expected to boost business-to-consumer e-commerce revenue from \$4.2 billion today to \$15.3 billion by 2003, according to IDC.

Part of Germany's digital dilemma can be tied to the difficulties it faces in dedicating information technology talent to Internet projects, according to the country's economics and technology minister, Siegmar Mosdorf.

To compete with U.S. companies that are exploiting Internet opportunities in his country, Mosdorf said, the German government needs to change regulations covering everything from venture capital investments to importing technical talent from overseas.

Greve said that although his company continues to expand, it's hampered by a dearth of qualified IT professionals. "We could definitely use more C++ programmers," he said.

Next month, Web.de is planning to add application service provider messaging services to its portal for German businesses, said Greve.

90% of your colleagues won't even think about making a purchase decision without consulting a white paper.*

What It's Like to Work at... Send.com

Interviewee: Josh Roman, director of e-commerce applications

Company: Send.com, a high-end online gift-giving service
Main location: Waltham, Mass.

Tenure: Since November 1998

Number of information technology employees: 30

Number of employees (end users): More than 100

Why such a high ratio of IT staff to end users? "We've found so many ways to use IT to help business outside of the actual [e-commerce] business model — ways to make people more efficient and smarter."

Major IT initiatives: Creating and installing a "completely homegrown content-management system that will allow us to [post and advertise] merchandise much more quickly than in the past"; developing a homegrown customer relationship management and call-center application; enhancing a custom-built extranet that connects the company with its fulfillment merchants nationwide; and relaunching the site, which will feature a new look and new e-commerce applications, in time for the holidays.

Deadline for the site relaunch: Oct. 30

Anticipated holiday traffic: "I can't give actual numbers, but generally, we expect 20 times our normal volume."

What kind of pressure does the relaunch and the holiday season put on the IT staff? "Longer hours and lots of informal meetings in hallways. Some people are working 9 a.m. to 9 p.m., and some are working 10 a.m. to whenever. And we're working weekends."

Are people sleeping in the office? "Not now, but around the launch, we'll probably have one or two people pulling an all-nighter. Starting this week, we're renting hotel rooms for the people who live further away, so they don't have to drive all the way home after a long day."

Must people carry beepers? Cell phones? "Not everyone. I do.... Normally, we might get beeped once a week, but around Christmas, the beepers are red hot, because

any downtime over the holidays would be fatal."

Any perks for the long workdays? "We provide dinner at the office and have fully stocked refrigerators with juices, snacks and generally a couple of six packs of beer. And we have a big off-site, post-launch party planned, with a racing car theme."

Favorite IT refreshments: "Fresh Samantha juices and these huge plastic barrels of pretzels."

Favorite stress relievers: Frisbee, "rousing games of Quake III" and Razor scooter races through the corridors. "We've terrorized a few people by coming around a corner too quickly and running into someone with an armful of printouts."

Compensation and bonuses: "Competitive salaries plus stock options. There are occasional performance bonuses, but they're pretty few and far between and usually based on going above and beyond the call of duty."

Career path options: "That's one of the things we're working on. There's definitely an engineering/development track and a project management track, but we're still working out the others."

Employee reviews: A formal annual review and informal quarterly reviews

Dress code: "Shorts and sandals, most days. I have a meeting today, so I'm pretty dressed up in jeans, a dress shirt and a vest."

Little perks: "Discounts on our products, which can be pretty cool when you toss in the exotic-car rentals."

Last companywide/department perk: "A 'Be Sick With Send Day' — a comp day for employees, where we could go to an amusement park, go golfing, go to movies or get free transportation to an outlet mall, on the company."

Would employees feel comfortable e-mailing the CEO, Mike Lannon? "Definitely — he talks to just about everyone."

Quote: "We have a lot of really intelligent people here. This is, by far, the smartest group of people I've ever worked with."

— Leslie Goff
(lgoff@ix.netcom.com)

ED YOURDON

Long-term thinking

I RECENTLY CONDUCTED a software engineering seminar for a group of experienced, motivated, highly educated software engineers and managers who passionately want to achieve higher levels of productivity and quality at their company. We discussed familiar concepts like object-oriented methodologies, software reuse and requirements management. We also

discussed how these concepts fit into the Software Engineering Institute's familiar Capability Maturity Model. But the more we talked, the more obvious it became that the absence of these techniques within their IT organization wasn't the problem and that their problem wouldn't be solved no matter how many "silver-bullet" techniques they introduced.

The real problem, quite simply, is the conflict between short-term constraints and long-term benefits. The political reality for software development teams is that they'll be rewarded if they deliver a system that meets most of the users' expectations, without being too far over budget and too far behind schedule. If the latent bugs aren't visible to users and if the system is actually delivered on schedule and *within* budget, they're heroes.

Delivering a high-quality requirements document, one that actually matches what the code does, may elicit a tepid compliment, but failing to deliver such a document won't even be noticed — not until months later, when the maintenance programmers try to add an enhancement to the system. All of the "ilities" associated with software development — portability, flexibility, scalability, reliability, maintainability — are rewarded only to the extent that they have been identified as major acceptance criteria during the project's development phase.

In short, those downstream strengths and weaknesses of the system are ignored when it comes time to parcel out rewards and punishment. We may give them lip service in the IT best-practices initiatives, but in the famous words from the movie *Jerry Maguire*, when it comes time to "show me the money," all that really counts is delivering a more-or-less working system, more or less on schedule. And until that behavior changes, pragmatic project managers will continue optimizing only the short-term benefits for which they're being rewarded.

It's convenient to blame this on today's short-term business mentality — that the short-term

IT deliverables are part of the corporate plan to meet this quarter's revenue objectives and this year's profit expectations — so Wall Street won't punish the stock price. But companies do know how to account for long-term costs and benefits: That's what capitalization, amortization and depreciation are all about.

We also know that software package vendors charge an annual maintenance fee of 10% to 15% of the initial purchase price of a package. So, we should be able to base our reward/punishment system on the *lifetime* costs of an IT project, rather than on just the first phase of development.

Say a typical IT system has an expected life span of six to seven years. (Yes, many of today's

systems have a shorter life span, possibly because they were designed so poorly.) Thus, the initial development cost is only about half the overall lifetime cost. Accordingly, only half of the overall bonus/reward should be issued for meeting the development schedule and budget; it would make more sense to wait until the system has survived the first year or two of maintenance to judge whether its overall lifetime costs will meet expectations.

If the maintenance department were similarly evaluated, it might be more adamant that the "ilities" have also been included in the development phase, which would lead to more emphasis on documentation, accurate requirements specifications and all those other Boy Scout principles we teach in software engineering courses.

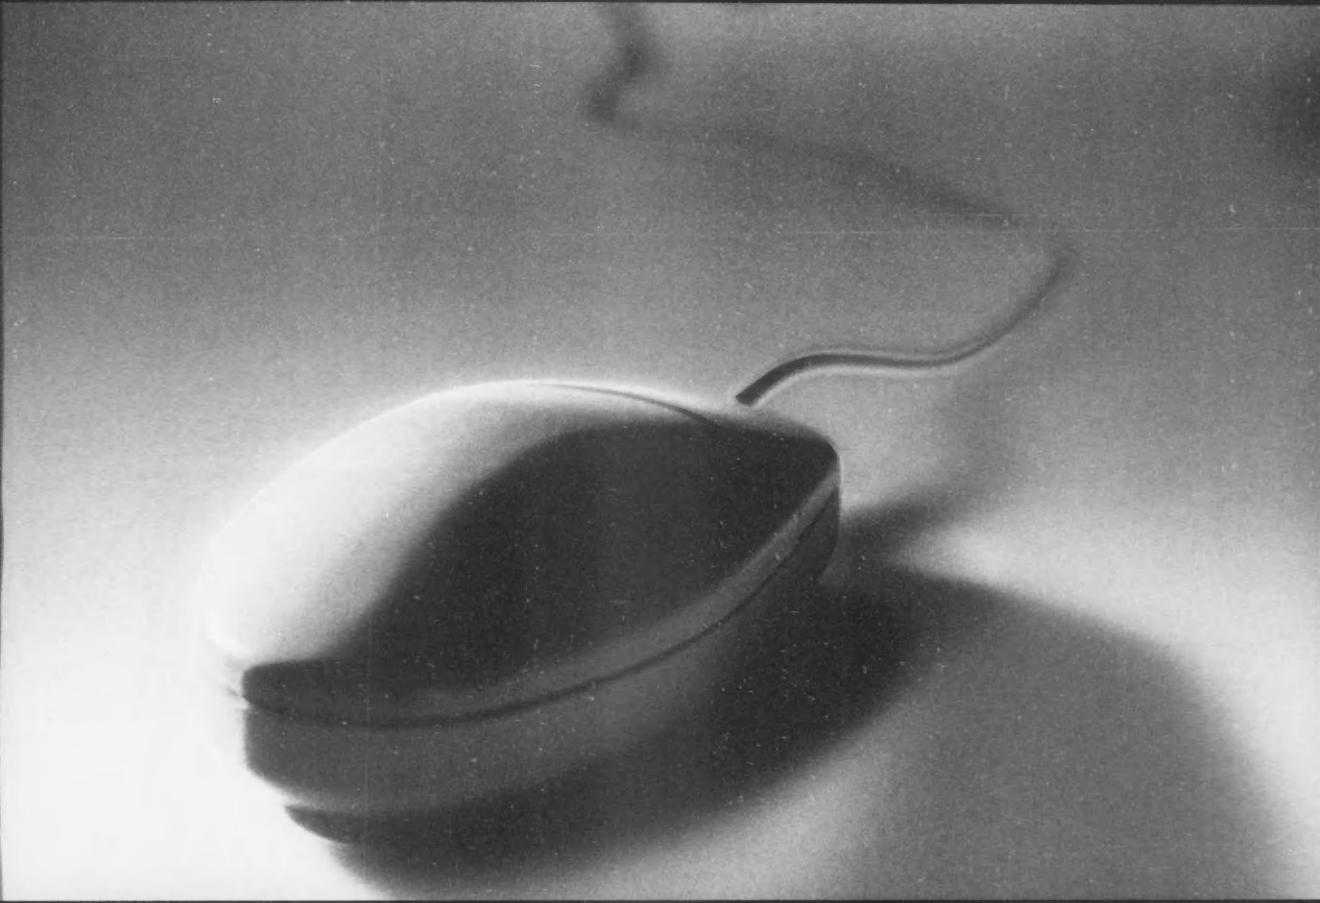

Realistically, none of this will happen in the average IT organization. Instead, senior IT executives will keep praying for miracles from

whatever silver-bullet methodology has captured the IT manager's fancy. But prayers aside, you get what you pay for. And if you only pay for short-term benefits, that's all you'll get. ▀

Prayers
aside, IT
executives
get what
they pay for.

DRAG. DROP. DONE.

THERE, YOU'VE JUST BUILT AN eBUSINESS.

Now there's a fast, easy way to put the "e" in your business. Introducing Aspect® eBusiness Architect, the revolutionary new development tool that takes you from imagination to application...in no time. eBusiness Architect provides a complete menu of pre-compiled, reusable common objects to let you quickly create eFlows: visual representations of your business rules that integrate your multimedia contact center, front- and back-office systems, and future applications into one centrally managed eBusiness. The result: dramatically improved and integrated eCommerce and eCRM capabilities. All without complicated code or costly deployment. Aspect eBusiness Architect. Suddenly, this whole eBusiness thing just clicks.

The Starting Point for eBusiness

BUILD YOUR eBUSINESS FASTER, SMARTER, CHEAPER,
GET YOUR FREE eBUSINESS ARCHITECT DEMO TODAY.

YETZER-RA, a 6-foot-3-inch, 300-pound giant of a man, paces between his "subjects" in the smoke-filled Goth club Click + Drag, located in the old meat-packing district of Manhattan.

Inside the club are leather-clad, black-lipped females and young men dressed in women's underwear.

Yetzer is a hacker and an acknowledged "social engineer" with curious nocturnal habits. There are thousands of people like him, who by day are system and network administrators, security analysts and start-up co-founders. When night comes, they transform into vampire wanna-bes, hedonists, Goths, cross-dressers and sadomasochists.

These are the self-proclaimed freedom fighters of cyberspace. They've even got a name for it: hactivism. And political parties and human rights groups are circling around to recruit hactivists into their many causes.

In July, for example, the Libertarian Party set up a table at the HOPE 2000 (Hackers on Planet Earth) conference. The San Francisco-based Electronic Frontier Foundation (EFF) collected donations. And members of civil-rights groups, including the Zapatistas, a Mexican rebel group, spoke up at one of two sessions on hactivism.

But even without such civil-liberties groups trying to organize them, hactivists have been busy on their own. They have formed privacy-related software companies like ZeroKnowledge Systems USA Inc. in Montreal. They're developing anonymous, inexpensive e-mail and Web-hosting services through the DataHaven Project Inc. (www.dhp.com). And they're trying to get the Internet out to Third World human rights organizations through groups like Cult of the Dead Cow Communications (cDc; www.cultdeadcow.com/hacktivismo.html).

In fact, Yetzer says he feels hactivism's pull so strongly that he makes a dramatic claim: "The Internet is the next Kent State, and we're the ones who are probably going to get shot."

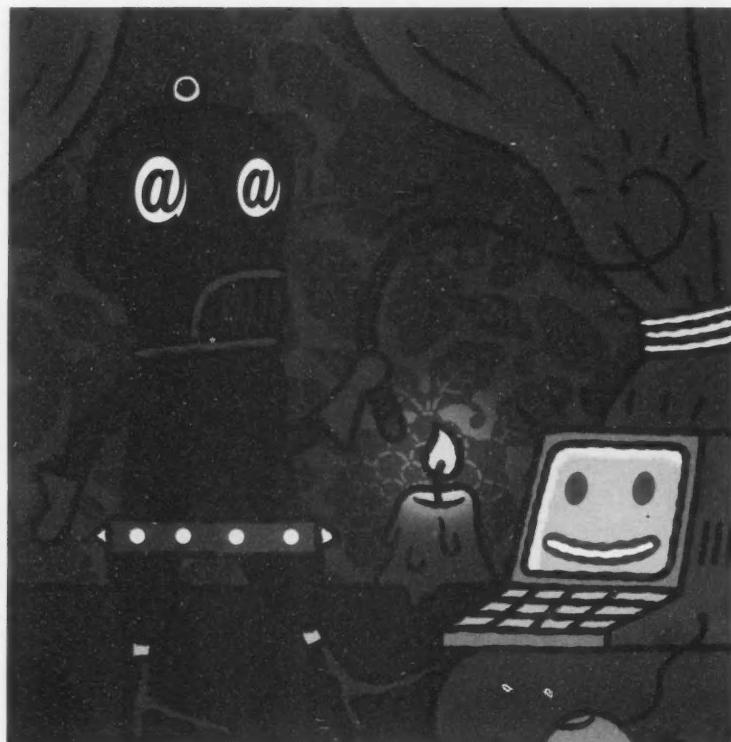

Vietnam Marches to Cyberdisobedience

Like any social engineer, Yetzer exaggerates. Except for the four-year jail terms handed down to Kevin Mitnick and Kevin Poulsen, sentencing for even criminal hacking in the past two years has been relatively light (mostly probation and fines) because of the suspects' young ages.

But the comparison to the psychedelic hippies of the '60s who spoke out against the Vietnam War may not be so far off the mark. Only this time, the hackers are Goths and hedonists. And they're using the Internet to rid the world of tyranny.

Continued on page 54

Welcome to the underground world of a group of computer hackers. They work in IT by day and fight for cyberfreedoms by night. They're also being called today's version of the '60s counterculture. Deborah Radcliff accepted their invitation to see what they're all about.

"The government tries to put electronic activism into the peg of cyber-terrorism and crime with its Infowar eulogies. But E-Hippies, CDc and others aren't criminals. The Internet just multiplies our voice," says Ricardo Dominguez, who edits a Zapatista revolutionary publication and operates the Electronic Disturbance Theater (www.thing.net/~rdom).

Dominguez has been working with the Zapatista rebels in Mexico since 1994 to develop nonviolent direct-action tools and spread information about conditions in Chiapas, a mountainous state in southern Mexico, where for the past five years the Zapatistas have clashed with the government.

"I want to bring the net.hacker, net-activist and net.artist into a dialogue about what we can leave to the future for those without a voice and without power — something the Zapatistas can teach us all," Dominguez says.

Another group reaching out to hackers and technologists is the EFF, which last year successfully argued in the infamous Bernstein ruling, which stated that software code is protected as a form of speech.

Robin Gross, the EFF's lead attorney in the case of the Encino, Calif.-based Motion Picture Association of America (MPAA) vs. 2600 Magazine, an online hacker quarterly, says hackers are naturals for political activism.

"[Hackers] question conventional models. They don't just look at technology and say, 'This is how it works.' They say, 'How can I make it better?'" Gross explains. "They look at society that way too — their government, their schools or their social situation. They say, 'I know how to make this better,' and they go for it."

In the MPAA case, staffers at Middle Island, N.Y.-based 2600 Enterprises Inc. were threatened with imprisonment if they didn't remove a link on the 2600 Web site to the code used to

crack DVD encryption. Because the link was editorial content, it sets Yetzer off on another diatribe.

"It's all about greed," Yetzer says, tapping his claw-handled cane on the wooden floor at Click + Drag. "But we have a fundamental right to watch our movies whatever way we want and share our music with who we want."

The Libertarian Party also recruits hackers and technologists. At HOPE, the party's New York State committee (www.cownow.com) handed out fliers, signed up recruits and took a "sticker" poll of party affiliations.

"The poll got hacked, but I'd say about half the stickers were yellow — for libertarian, anarchist or independent," says Bonnie Scott, who heads the Libertarians' New York state committee under the hacker handle Rabbit.

According to Scott, many party members are programmers. "We're trying to rally hackers around encryption, privacy and freedom-of-communication planks," she explains. "Hackers can offer us ... freedom, because the Internet routes around tyranny."

But hackers have ways beyond the Internet to electronically spread their message.

Take a young dude named Numeric Overflow, for instance, who late one night broke the lock to a lit-up roadside-construction sign and reprogrammed it to read, "Hack Planet Earth" in support of the 2600 Magazine staff. But then, he also says he likes to use his reprogrammed garage-door opener to pop open his neighbor's garage doors.

Sound a lot like Yetzer, Numeric justifies this in the pedantic hacker way. "One of my friend's mothers sees me later and says, 'Oh, don't let that guy come over again,' like I'm some hoodlum or something," Numeric, 21, says. "But isn't it better that I showed them before someone else did it and stole their stuff?"

Growing Up

This moral confusion is typical of the younger hacking crowd. But Stanton McCandish, advocacy director at the EFF, says most of the older hackers (28 years and up) have grown up.

"I saw disillusionment in the mid-1990s, as more bleeding-edge hackers ended up going to jail for cracking. That bummed out their whole theme," McCandish says. "But now they've learned some limits, and they can still operate within them."

That means the older hackers do develop some scruples. For example, McCandish recounts that the EFF Web site (www.eff.org) was a popular target of punk hackers back in the mid-'90s, with hacks and defacements occurring weekly. Now, it's been six months since the last attack on the EFF's site, he says. When the site did get hacked,

[Hackers] don't just look at technology and say, 'This is how it works.' They say, 'How can I make it better?'

**ROBIN GROSS, LEAD ATTORNEY,
ELECTRONIC FRONTIER
FOUNDATION**

McCandish posted a message about it on 2600's bulletin board, and the "hackers who responded called that hacker a lamer," he says.

Get a load of Yetzer's scruples. A Windows NT administrator by day, Yetzer, 28, says he can't stand that his former employer, an East Coast-based Web-hosting firm, lies to its customers.

"My leader, the grand Bruhaha, had this ethical dilemma," he says over the din of technomelodic music pulsing from Click + Drag's dance floor. "We had this three-hour power failure. When clients called in, I told them the truth: that we'd had a power failure. I got demoted for that. My co-worker told them we got struck by lightning. He got a promotion."

Yetzer later quit without leaving any logic bombs or Back Orifices on the network. "Would serve them right," he says. But Yetzer, the grown-up with scruples, adds, "Of course, if I did anything like that, I'd never work again."

There are even more mature hackers ahead of Yetzer who have grown into heavy hitters in the information technology community. Hackers like Yobie Benjamin, 40, a partner at New York-based Ernst & Young International.

Infamous hackers Mudge, Weld and Hobbit are another example of maturity, having spun off a venture capital-backed consulting services firm called @Stake Inc. in Cambridge, Mass., which now has five offices around the country.

McCandish says this growth process is no different than the hippies who spun off their surfboard and T-shirt shops into big businesses after they grew up.

"The process that turned the dope-smoking hippie of 1968 into the employed investor of 1985 is similarly going on here today," says McCandish. "I just hope that the hippie-to-yuppie disillusionment that took place historically doesn't happen to hackers, too."

In the Eyes of the Law

IAN POYNTER, a 20-year IT veteran who owns Jerboa Inc., an IT consulting firm in Cambridge, Mass., says it's difficult to cast moral judgment on activists:

"I don't think hacking is necessarily good or bad. What they're doing is raising awareness and forcing people to think about things. That's what activists do," he explains. "It's a fuzzy, gray area. Whose morals are we talking about? Who decides them?"

Right now, acceptable morals are determined by the letter of the law, says Jim Christy, a supervisory special agent and counterintelligence coordinator at the U.S. Department of Defense's Informa-

tion-assurance program.

Christy says the authorities don't have any problems with activists, as long as they work within the law. But he doesn't condone electronic trespassing, data hijacking or hacking of Web sites, which he likens to protesters breaking windows at the World Trade Organization summit in Seattle in January.

"Laws exist to protect innocent third parties, like those business owners in Seattle who were damaged monetarily," Christy explains. "If the laws don't work, then they should be changed through the political process."

NEW STANDARDS
NEW DEMANDS
NEW EXPECTATIONS
NEW WORK
[NEW WORLD]**

NEW WORLD
NEW ATTITUDE
NEW SERVERS

[@server]

**NEW
WORLD**

e-business.

First there were stock prices and movie times online.

Then there were new business plans and bold new valuations. Now, e-business is a part of the basic DNA of every business, regardless of size, industry or sophistication. Not as "Internet foray," but as broad strategic plan. Not in lieu of business principles, but in search of radically new business results. Not as faddish technology, but as basic business infrastructure.

The hype has peaked,

but the meaningful change has just begun.

NEW THINKING

A new world demands new thinking.

New thinking about e-business infrastructure and new thinking about servers—from how they're designed, delivered, integrated and supported to how they are assured in operation.

Why? Because business today means preparing, evaluating and adjusting, every day, for relentless change and unpredictable growth.

In infrastructure, this new world means breaking away from a rigid past of single platforms, closed standards, and integration as an afterthought. It means embracing and championing flexibility and openness, without compromising reliability.

At IBM, it means an entirely new breed of servers, built from the ground up for e-business.

Introducing IBM *e*server

Servers made possible by new IBM innovations, legendary mainframe-level expertise, acknowledged e-business leadership, and a commitment to create new tools to meet new demands.

This is not about a few more megahertz. This is about new thinking backed up with new actions.

New servers. A new line of best-of-breed servers, covering every platform from Windows[®] 2000 to UNIX[®] to Linux.[®] And new enhancements to WebSphere,[™] IBM e-business software, to provide web-enabled integration across 35 application environments.

Superior performance. New raw power and cost-effectiveness through IBM science, like the 30% to 40% speed gains of new IBM second-generation copper chips with silicon-on-insulator technology. Proof? The new pSeries 680, which employs both technologies, is the fastest Web server on earth.¹

Open standards. New IBM servers are built to embrace open standards like Linux, and all of IBM is ready to support Linux. Want the best of both worlds? Match the flexibility, affordability and freedom brought to you by the Linux community with the assurance of IBM service, support and consulting services.

Capacity on demand. Have extra capacity on hand, but don't pay for it until you use it.² IBM now offers Capacity Advantage—additional internal processors or even entire servers preinstalled onsite, ready for activation, 24x7, on a pay-as-you-grow basis.

Uptime assurance. High availability services from IBM can help assure uptime performance on new IBM servers, even help assure uptime across applications, networks and entire enterprises.

NEW SCIENCE

Power. IBM just built the world's fastest computer, capable of over 12 trillion calculations/second—enough power to process an online transaction from every man, woman and child on earth in one minute.

Efficiency. IBM Memory eXpansion Technology doubles the capacity of server memory. Soon you can cut memory costs without sacrificing performance, or increase performance at no extra cost.

Maximum Linux. The new z900 server can run thousands of Linux images simultaneously as virtual servers. All for under \$500 an image, putting it among the most cost-effective Linux servers in the world.³

NEW SERVERS

IBM @server xSeries

Affordable, Linux-ready, Intel®-based servers with mainframe-inspired reliability technologies.

1U rackable server | up to 2-way Intel Pentium® III processors 1GHz | new cable-chaining technology | up to 4GB memory | integrated service processor | hot-swap drives | Light Path Diagnostics™ runs Linux, Windows 2000 and Windows NT® | Netfinity® Director™ management software | the x330 starts at \$4,426⁴ | xSeries models start at \$1,413⁵

IBM @server iSeries

Fast implementation, high performance and near-zero maintenance for thousands of ready-to-run business solutions.

Sixth generation 64-bit chips | new copper and SOI technology | up to 16GB memory | up to 4TB disk | hot-plug PCI | 1GB/s high-speed link | enterprise-class Logical Partitioning (LPAR) | 99.9+% reliability out of the box | integrated operating system, middleware, database and communications for high performance and fast ROI | 1-year warranty, 24x7 onsite service | the iSeries 400 Model 820 starts at \$34,925⁶ | iSeries models start at \$10,413⁷

IBM @server pSeries

The most powerful, technologically advanced UNIX servers.

RS64 IV 64-bit processor 600MHz | 16MB L2 cache | 6-, 12-, 18- or 24-way configurations | up to 873GB hot-swap storage | supports up to 45TB of SSA storage | 4GB SDRAM expandable to 96GB | IBM AIX® operating system, rated #1 by D.H. Brown⁸ | the p680 starts at \$420,000⁹ | pSeries models start at \$13,599¹⁰

IBM @server zSeries

The most reliable, mission-critical data transaction servers on earth.

Designed for up to 99.999% availability¹¹ (down just 5 minutes/year) | up to 640-way, clustered with up to 2TB memory | integrated cryptographic coprocessors yielding 64,000 SSL/sec.¹² | automatic system resource reallocation | runs z/OS, Linux, S/390® software | HiperSockets @24GB/sec. | workload-based software pricing | under \$500 per Linux image¹³

eServer

For the next generation of e-business.

THERE WAS, there weren't many entries in the technospeak dictionary. *Basic*, the now-obsolete programming language, was tossed around, as was *bulletin board service*, a precursor to the Internet.

Then the '90s hit, and the *World Wide Web* caught on. Shortly thereafter, *FTP* (short for *file transfer protocol*), *HTML*, *URL* and *e-mail* became part of the standard lexicon. Eventually, *e-commerce* joined the fray, with *.coms* popping up right and left and *e-retailers* edging in on some of the world's most successful retail chains.

Companies started devoting their time and money toward *enterprise resource planning* implementations that tied legacy systems to new *customer relationship management* programs.

But if you think you've mastered technospeak, think again. It's a constantly evolving beast. Some terms are helpful ways of describing the uncharted territory of today's technology. Others are simply catchphrases with shorter shelf lives than the products, services or trends they describe.

Here's a look at some of the new buzzwords making their way around the information technology circuit:

► **A-to-A:** OK, so you've heard of *business-to-business* and *business-to-consumer*. But as e-commerce grows more sophisticated, it's becoming abundantly clear that the wave of the future is for anyone to be able to do business with anyone else, hence *A-to-A*. That includes not only business-to-business and business-to-consumer, but consumer-to-consumer, business-to-business-to-consumer, business-to-exchange and of course, with today's tight labor market ...

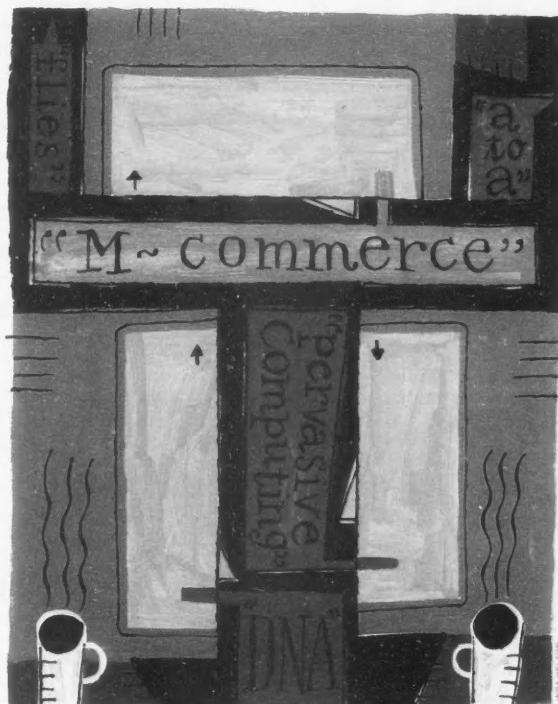

► **Business-to-employee:** It's a tough-enough job to attract skilled talent these days; keeping your workers satisfied is even more challenging. That's why companies are paying more attention than ever to some of their most important customers — their employees. Sophisticated technology, competitive wages and employee recognition strategies are now given as much weight in many IT shops as customer service.

► **Business-process outsourcers (BPO):** Yet another form of application service provider, BPOs offer IT services for automating specific business processes. BPOs can help companies cut the expense of entire departments so they can concentrate their energies on core competencies.

► **Collaborative commerce:** Now that anyone can do business with anyone else, a whole new level of cooperation needs to take place. As businesses that have traditionally been competitors start working together, they need to engage in collaborative commerce, which is essentially the lifeblood of on-

MASTERING THE NEW TECHNOSPEAK

A quick look at some of the new business-technology buzzwords you didn't know, and why you're glad you do now. By Melissa Solomon

line business exchanges. And as companies work together, they need to determine how to facilitate the flow of information needed to make the partnership work.

► **DNA:** No, not the stuff used to get wrongfully convicted people off death

row. DNA refers to the indefinable characteristic that executives need to make a business fly. The big question on the minds of venture capitalists looking to make a good investment is whether the CIO or CEO has the DNA to do the job.

► **Electronic invoice presentation (EIP):**

Another term flowing through the business-to-business exchanges on the Web, EIP, simply put, is the same as electronic bill presentation and payment — or billing and accepting payments online. The difference is that EIP is specifically for business-to-business transactions.

► **Flies:** You know them: the people who spend hours glued to their computers viewing ads so they can rack up the "rewards." Flies are sucked into the Web by those clever marketing strategies that offer free points, coupons and credit toward merchandise.

► **Internet application integration:** One strategy for implementing collaborative-commerce practices is Internet application integration. This allows companies that partner in a supply chain to automate cross-enterprise business processes by linking their different software applications over the Internet. It takes enterprise application integration to a whole new level.

► **M-commerce:** Now that you're starting to figure out the intricacies of e-commerce, it's time to move on to new challenges. M-commerce, or m-business, refers to the next major revolution — mobile computing.

► **Pervasive computing:** Yes, this term has been around for a while. But as companies move toward m-commerce, pervasive computing is moving closer to reality than ever before. Essentially, it means that computing will be everywhere and play a role in even the most basic human tasks. Many consumers already use their computers to do their grocery shopping and pay bills, but technology will touch just about every aspect of our lives as computers become more portable and accessible.

► **Trade credits:** Yet another business-to-business-specific term. Trade credits are a new form of online financing specifically geared toward business-to-business exchanges.

► **Voice service providers:** Sure, you can hire an application service provider to handle your systems. But as businesses become around-the-clock operations, employees need to be reached anytime, anywhere. Voice service providers offer a single phone number that's tied into someone's voice, fax, cell and pager numbers. But don't call them VSPs, because that refers to ...

► **Vertical service providers (VSP):** These are industry-specific application service providers. VSPs offer IT services with special expertise in, say, the automotive or health care industry.

► **Wireless Markup Language (WML):** As wireless technology gains speed, WML is quickly replacing the standard Internet programming language, HTML. WML allows users to retrieve and display files for Wireless Application Protocol-based phones. ■

EVER NOTICE how some executives flourish when they're suddenly faced with a crisis situation, while others seem to get that deer-in-the-headlights look about them?

In an admittedly unscientific personality test, *Computerworld* posed six hypothetical management challenges to two information technology leaders who have climbed to the top ranks at Fortune 200 companies: Bruce Freeman, CIO at Fort Worth, Texas-based Burlington Northern Santa Fe Corp., who has a business background, and Steve Finnerty, CIO at Northfield, Ill.-based Kraft Foods Inc. (the North American food business of Philip Morris Cos.), who has risen through the technology ranks.

You have a new CEO; what are your top three priorities?

■ **Freeman:** First off, I'd want to find out their agenda, for the short term and the long term. Then, I'd develop a customized value proposition that would match up against his or her priorities pretty quickly. I'd use that to sell myself and my department. [The new CEO] probably wants to do some-

thing that shows early on that he's the right person for the position. There's no better enabler than IT to help do that.

■ **Finnerty:** First, you want to establish a personal relationship with that person. I'd start out with a discussion of what [he's] trying to accomplish. In that discussion, you get to know that person and their style and establish rapport. But to sustain that rapport you have to deliver results. You need to determine what his or her priorities are, then go back and develop and communicate your plan to achieve those objectives and those priorities.

Your people are deserting you like rats from a sinking ship. You get the feeling it's more than just the normal turnover. What do you do?

■ **Freeman:** You've got to pretty quickly stop the bleeding and assess what's going on. I'd get into the department and ask them point-blank what is happening and what do we need to do to fix it. My attrition rate is not that high — 8% or 9% — but I'm still losing people. I didn't think I would lose. The second thing is to figure out what you can change. It's not all [about] the pay. It's challenge, opportunity, a chance for growth, culture, leadership and money. Because we're part of a railroad [company], I know I have challenges in pay

structure. We have a multilayered pay structure with bonuses and stock options. But you talk to 23-year-olds, and they don't care about stock options. They want to buy that new car right now.

■ **Finnerty:** First, listen to people. I'd do one-on-ones across the organization and in small groups and find out the barriers to their being successful and also what are we doing right. I'd answer the concerns very quickly with a plan: 'I heard you; here's what we're planning to do.' You also need to develop and communicate the vision of where we're going so people have a sense of purpose.

“

It's not all [about] the pay. It's challenge, opportunity, a chance for growth, culture, leadership and money.

BRUCE FREEMAN, CIO,
BURLINGTON NORTHERN SANTA FE CORP.

You're an imported CIO with no track record, but your users/customers hate, mistrust and vilify IT based on the performance of the previous CIO and his shop. How do you turn this around and establish a good working relationship?

■ **Freeman:** First, be humble. Don't go in with all the answers. Go in and be a good listener. Find out why they hate IT, what IT didn't do for them. Did IT not give them a PC or not follow their directions? Find out the issues to change the relationship. Then I'd try to adapt and build a plan they'd buy into as a good opportunity to make them successful.

Another point is that you got probably just as big an issue behind the scenes because [the IT] staff has the same feelings and concerns about what is this guy going to do differently. You've also got to sell yourself to your department and buffer them from being beat up as they were previously.

■ **Finnerty:** I would have one-on-ones with leaders of the organization. I'd listen very intently to their issues and get a sense of their priorities. . . . You need to communicate a lot in terms of managing expectations about what's possible. You can't just talk a good game; you have to deliver results.

You have a multimillion-dollar business/IT project that's six months late and out of control. The CEO is breathing down your neck. A competitor has just gone live with a similar project. How do you get the project back on track?

■ **Freeman:** First thing is you've got to listen. You've got to identify the issues quick, then demonstrate a change of direction and correction. If I walked into a project like that and started talking to the programmers, I'd get strong opinions about what the problems are — things like not enough people or working too many hours. You're not looking to have a witch hunt or make a scapegoat, but you have to demonstrate to your staff and your customers that you're going to change the situation. . . . If you do that quickly, you build a level of support with people who have been banging their heads against the wall.

■ **Finnerty:** I have a leadership issue either from the IS or the business process side. Do I need to make a change? Then I would focus on the critical: Cut back on deliverables and get the 20% [of function] that delivers the 80% [of the benefits]. I'd also apply Project Management 101: a plan, resources, know your deliverables and track along.

Your company has just recorded its third straight quarter of disappointing financial results. All department heads are expected to arrive at the next executive council meeting with at least three surefire ideas for either revenue improvements or cost cuts of 20% to 30% that are achievable within a

ON THE SPOT

Two IT leaders describe how they would tackle six hypothetical management challenges. By Julia King and Kathleen Melymuka

BUSINESS MANAGING

year. What are your suggestions and how would you pitch them?

■ **Freeman:** The first thing I'd do is try to get myself last on the agenda. Before the meeting, I'd meet with all of the other department heads to find out their three things. I'd want to understand their initiatives, then bring IT in as a means of accomplishing their goals. I've never been in a situation where another department head with an idea to grow revenue or cut costs hasn't required technology. In these situations, I've sometimes gotten added funding because of another department head's idea. As an absolute worst case, I'd rank and prioritize projects and reduce head count.

■ **Finnerty:** I think the first thing is you need to accept the reality of the situation. So I'd do that, put a business hat on and think from a technology and business perspective. I'd get a sense of how long this is going to last. If there's a fundamental long-term problem, I'd react differently than if it's a temporary downturn in the market. If it's temporary, I'd delay some things. If it's a fundamental change, you say, 'This is an opportunity to challenge old paradigms and come up with some creative ideas.'

I'd be quick to partner with the business-process people to be sure we were in alignment. They might want to work creatively to surface some business-process ideas.

I'd discuss this all with the CEO ahead of time if I could and give him or her options and recommendations. Then you need to come in realizing that things may move because there will be new discussion and ideas. So you need to know where you can move [compromise] and where you can't.

You're thinking about taking early retirement, but then along comes an offer you just can't refuse. What's that offer, and why can't you pass it up?

■ **Freeman:** Two things would keep me from retirement. I'd be interested in taking on a leadership role in a start-up company, which wouldn't necessarily have to be a dot-com. The CIO-for-hire role in a turnaround situation would also be interesting.

■ **Finnerty:** I view opportunities by saying, 'What's my purpose in life? Why am I here? What are the values and principles I follow from a life perspective?' I use a river analogy: The Mississippi has a purpose — to get to the Gulf of Mexico. The vision is the Gulf; the principles and values are the banks of the river. One of the principles, clearly, is life balance. When you go outside the banks, you flood the farmland. When you're in the flow, and an opportunity comes along, you say, 'How does that fit to my life purpose — what I'm trying to do or become?' Intuitively, it's obvious whether it's a right thing to do. ■

■ **BRUCE FREEMAN, 50,** is vice president and CIO at Burlington Northern Santa Fe in Fort Worth, Texas. His previous positions range from project manager to vice president of applications development, a post in which he was responsible for all business and technology planning surrounding the merger of the Burlington Northern and Santa Fe railroads

■ **STEVE FINNERTY, 51,** is vice president and CIO at Kraft Foods in Northfield, Ill. Finnerty, who previously served as Kraft's chief technology officer, was formerly vice president of information systems and supply-chain management at J. M. Huber Corp. in Edison, N.J., and director of information systems at Johnson Controls Inc. in Milwaukee

TECHNOLOGY TITANS are making headlines with the fabulous sums they're donating to charity.

Bill and Melinda Gates' foundation has contributed \$22 billion to international children's health agencies.

Oracle Chairman Larry Ellison has promised \$100 million to help computerize American schoolrooms.

Patrick J. McGovern, founder and chairman of International Data Group, the owner of Computerworld, was cited in *Time* magazine as the seventh most generous philanthropist in the U.S., with donations and pledges of \$350 million.

While most information technology professionals don't share their vast wealth, many share the megadonors' generosity of spirit and give what they can to make the world a better place. Meet four IT professionals whose neighborhoods are richer because they donate their time and talent.

■ DON SUNDERLAND

CIO

Edison Schools Inc.

New York

Every other Friday for several years, Don Sunderland would leave the office a little early — with his boss's blessings — and hurry uptown with his guitar. He wasn't auditioning for Britney Spears' band. He was leading sing-alongs at the Manhattan School for Children, an alternative public school on the Upper West Side. He and his wife, Ruth, are among the school's founding families.

"We loved the cultural and ethnic diversity of the West Side, but we couldn't help but note that the preschool our children were in looked as if we were in Westchester," says Sunderland, referring to the mostly suburban county just north of New York.

Determined to create a "true neighborhood school" with a mix of black, Hispanic and white children, a group of parents worked with the New York City public school system to launch the Manhattan School for Children's kindergarten and first grade in 1992. The school has since expanded up to the eighth grade. Located on West 93rd Street, it's now known as Public School 333.

Formerly the head of technology at a Wall Street firm, Sunderland could have afforded to send his children to private school. He says he didn't want to.

"I believe that public education is the American dream, the dream of immigrants that their children will receive the rights of passage to better lives through education. Anything that takes money out of public education and redirects it to private education has class distinction associated with it and penalizes those who are at a socioeconomic disadvantage," says Sunderland.

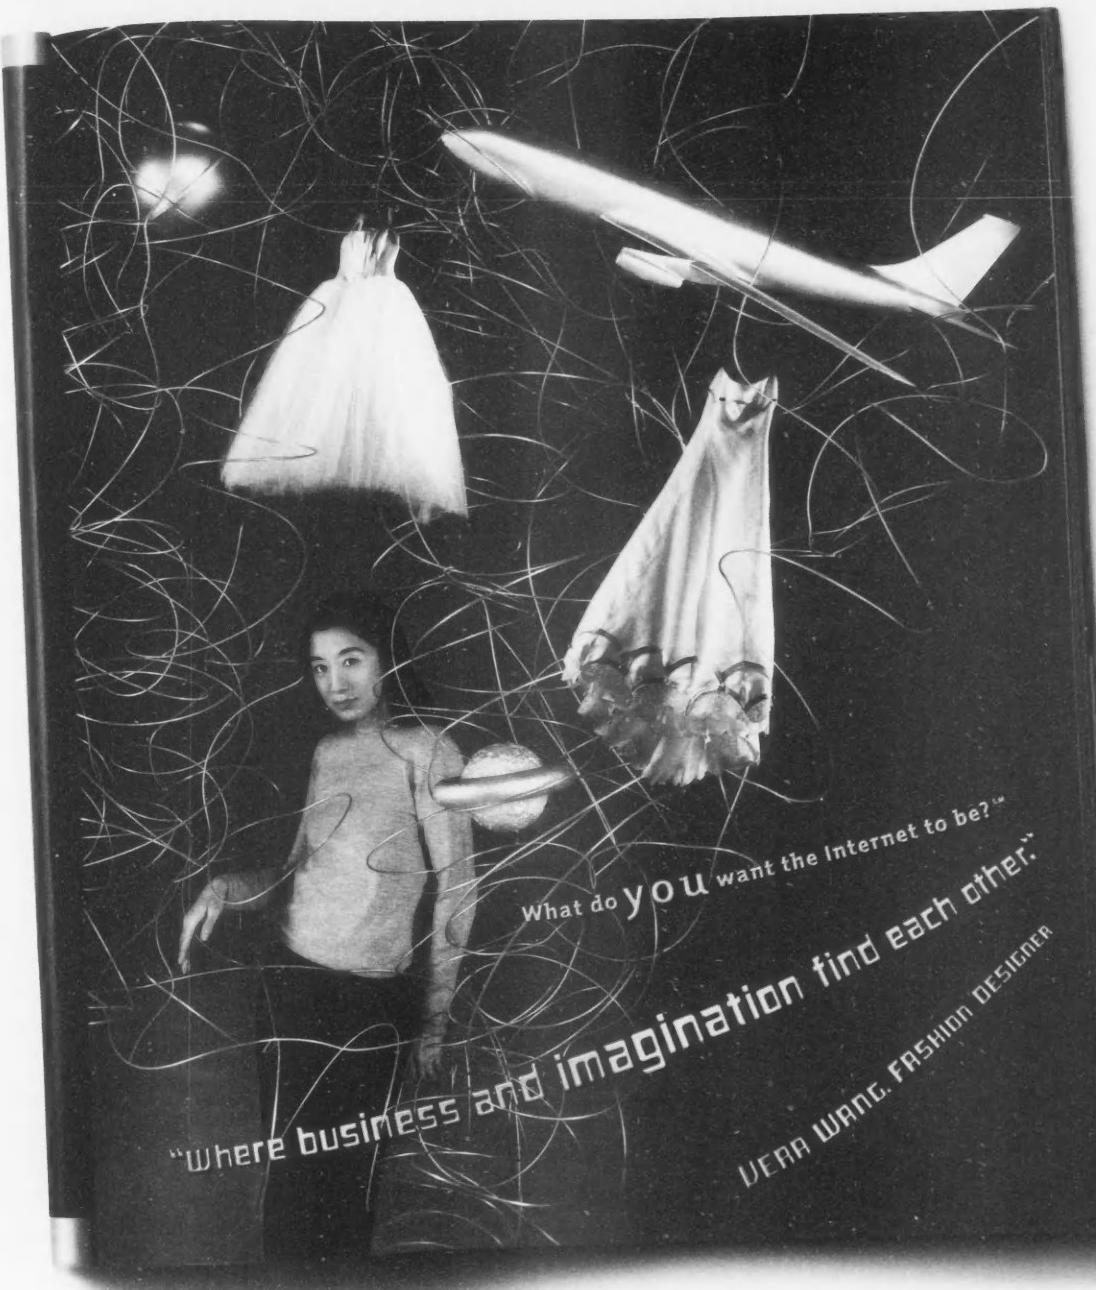

That passion led Sunderland to accept his current position as CIO of Edison Schools. Founded in 1992 as The Edison Project, Edison Schools is the country's leading private manager of public schools. Many

of the schools Edison manages were underperforming before the company stepped in to rebuild them around a strong academic program, applied technology and an emphasis on parental involvement.

Edison has implemented its school design in more than 80 public and charter schools, which it operates under management contracts with local school districts and charter school boards. Each Edison school consists of small schools within schools, called "academies." The concept is similar to the one used at the Manhattan School for Children.

In Edison schools, technology is integrated into the curriculum. Every student, teacher, principal and administrator has easy access to classroom computers, video cameras, televisions and more. Every family with a student in the third grade or higher receives technology to use at home, and every teacher receives his own laptop computer.

In his involvement as a founding family member, past treasurer and parent of kids at the Manhattan School for Children, Sunderland says, "I learned the battles of opening schools and dealing with public education in an inner-city setting, and that very much applies to what we encounter at Edison."

■ STEPHEN RAYE

CIO

*GeneralCologne Life Re of America
Stamford, Conn.*

Stephen Raye knows firsthand that "Stamford is not all 4-acre zoning." In a region of the country that most Americans view as wealthy, Raye has found opportunities to support those in the community who must work two jobs to make ends meet.

Raye is a founding board member of the Mutual Housing Association of Southwest Connecticut in Stamford, a nonprofit organization created to provide affordable housing for people who are willing to commit themselves to ongoing community improvement tasks such as making repairs on buildings or cleaning up trash. As part of his involvement, Raye has walked the nightly crime patrol in the neighborhoods he helped establish.

"As a CIO, the skills you need are communication, relationship management and the ability to listen," says Raye. "That was what was needed at the Mutual Housing Association. We had a list of people who wanted housing that was longer than the list of the housing available. We created policies and procedures that would qualify people for the housing on an equitable basis."

In addition, Raye has served for more than two years on the Norwalk, Conn.-based Norwalk Community College (NCC) Information Technology Advisory Council. The council advises the two-year college on its curriculum, infrastructure and industry trends.

"Norwalk Community College is very aggressive in its mission of providing a world-class facility to educate and train IT professionals," says Raye. He says he appreciates the chance to serve on the IT Advisory Council, where he can help "fine-tune the IT programs, which provide us with talented IT interns and full-time employees."

When the college was planning a new building, Raye invited those in charge of the project to visit his company and examine its IT infrastructure so they could get a firsthand look at industry best practices. Raye also hired one of NCC's nontraditional students — a woman who had previously earned a math degree and was returning to the workplace and learning computer skills at NCC after raising her children.

"The members of the IT Advisory Council are absolutely the best group of people I've ever worked

with," says William Schwab, president of NCC. "They keep us on task and give us such good advice."

■ WILLIAM WEBSTER

*Vice president, information management — consumer
Bristol-Myers Squibb Co.
Stamford, Conn.*

Another member of NCC's IT Advisory Council is William Webster, who has served slightly less than a

Getting Started

STEP ONE: Meet new people.

"When you get out of the meeting room or the tech room and get into the community, you meet the most incredible people in your life," says Don Sunderland, CIO of Edison Schools.

As a volunteer at the Manhattan School for Children, Sunderland didn't install or support the school's computer systems. His Unix background didn't mesh with the "Macintosh orientation" of the education community.

"We run across the same issues at Edison Schools," Sunderland says. "The idea of considering alternative platforms is divisive. I got over arguing about it years ago. We put up the technology that works for the job we have to do." Edison Schools recently struck a deal with IBM to roll out desktops and infrastructure to dozens of U.S. schools.

STEP TWO: Start slowly.

"Sit on a committee to understand how a nonprofit organization works and then take on more responsibility as you learn," says Gina Potenza, manager of technical infrastructure at Lincoln Life and Annuity Company of New York.

Potenza started by offering her technical expertise to area nonprofit organizations and then increased her volunteer activities to allow her the chance to work with kids and to work on and lead teams. "Once you begin as a volunteer, it motivates you to do more," she says. She brought the management experience she gained serving on a volunteer committee back to her job, where she was promoted from systems administrator to manager of technical infrastructure.

STEP THREE: Give what you can.

"Don't think you have to give your volunteer activities the same number of hours you give your career. Even a small number of volunteer hours can make a big difference to the community or nonprofit association. Slice off some time from your schedule here and there and it pays off," says Steve Raye, CIO at GeneralCologne Life Re of America.

Smart Companies Support Volunteerism

A CIO leading a sing-along. An infrastructure manager playing fairy godmother. Another CIO patrolling a city neighborhood. Nice for them and nice for the people they help, but what's in it for their companies?

Plenty, according to a survey of more than 2,700 U.S. companies conducted last year by The Points of Light Foundation and The Conference Board.

94% of executives responding to the survey said they agree that volunteerism improves a company's public image.

93% said they agree that volunteerism builds employee teamwork skills.

74% said they agree that volunteerism increases employee productivity.

year. Bristol-Myers Squibb has hired NCC students for internship programs. "Community colleges address a portion of the population that aren't addressed by state four-year colleges and private universities," he says. "I feel good about helping young people get an education that immediately can be used in their life's work."

To that end, Webster is also working to establish a chapter of the Chicago-based Society of Information Management (SIM) in the area of Westchester County, N.Y., and Fairfield County, Conn. The SIM chapter founders will hold organizational meetings through this year, with the intention of launching the first general session in January.

"SIM helps groom the next level of executives who will take over our functions," Webster says.

■ GINA POTENZA

*Manager of technical infrastructure
Lincoln Life and Annuity Company of New York
Syracuse, N.Y.*

Gina Potenza is an official wish-granter. As a specially trained member of the central New York chapter of the Phoenix-based Make-A-Wish Foundation of America, Potenza is authorized to fulfill the desires of critically ill children in her community. The whole point is to focus the family's attention on having fun together instead of on the disease that threatens the child's life, Potenza says.

"The first wish I granted was for a little girl with lupus who loves Rosie O'Donnell and wanted to meet her," says Potenza.

Not only did Potenza make the youngster's wish come true, but she also embellished it. Potenza arranged for the girl's entire family to spend a week in New York. A limousine took them to the airport, and the kids received backpacks stuffed with goodies and games to keep them occupied during the flight and cameras and notebooks to record their adventure.

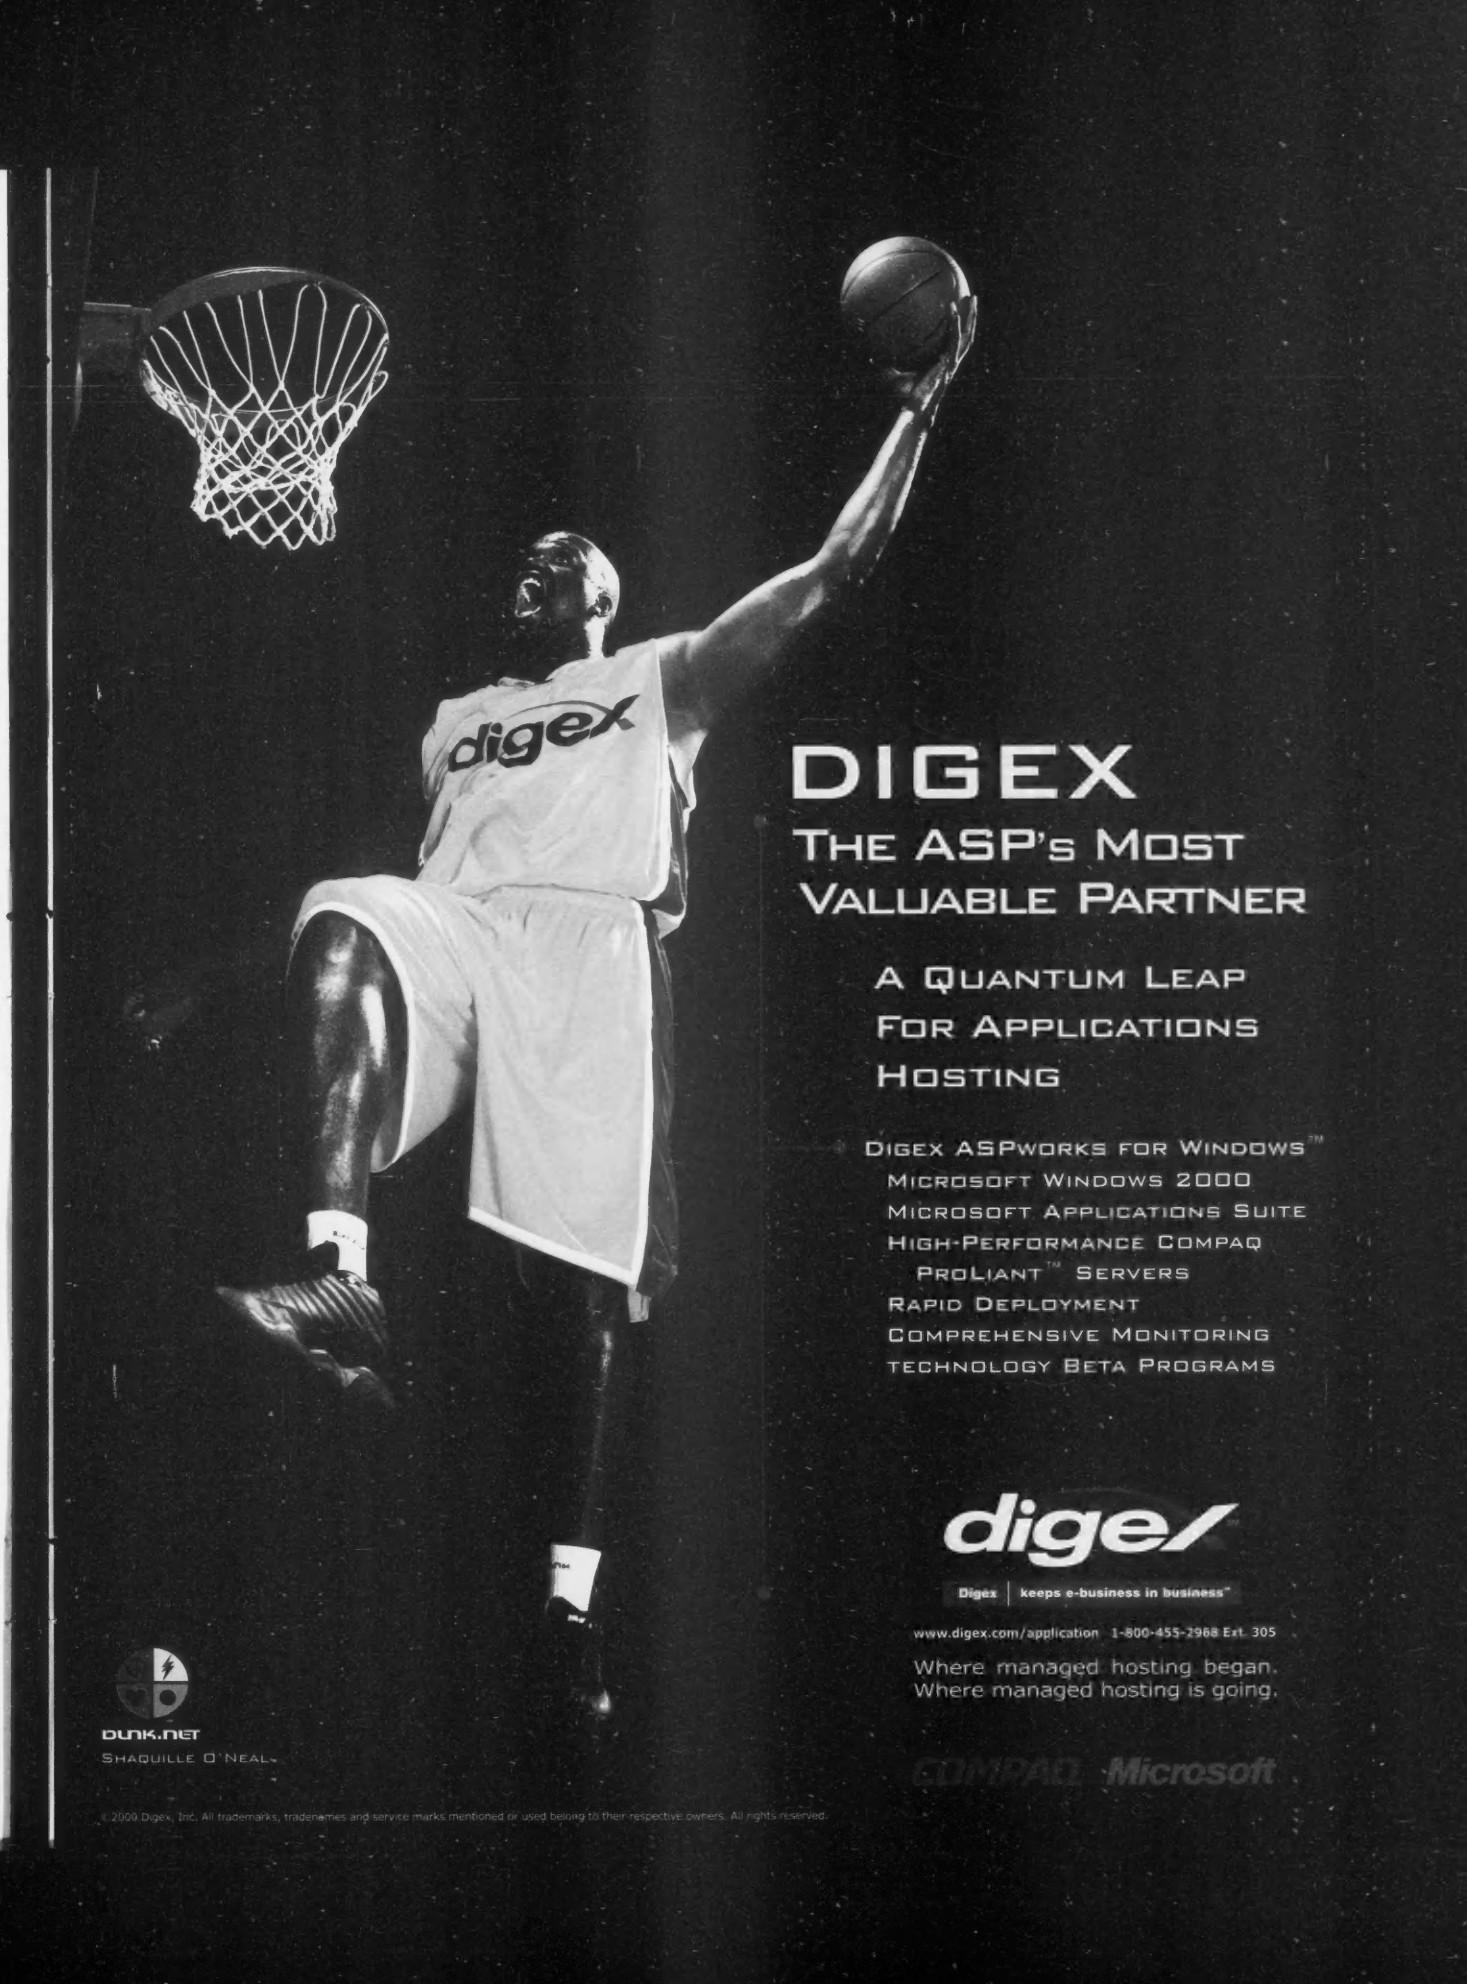

They met the popular comedian and talk show host backstage and were members of the audience through two tapings of her TV show. The family visited tourist spots such as the Empire State Building and the Statue of Liberty. The entire wish fulfillment was paid for by the foundation. "There is no monetary limit on a wish, and the average wish is \$5,000, since we enhance them so much," says Potenza, who also serves on the chapter's fund-raising committee.

Two years ago, Potenza decided to put feet to her desire to give back to her community. She asked the advice of a senior manager at Lincoln Life and Annuity who was known for her volunteerism. The mentor helped Potenza identify organizations in the community that were involved in helping children.

"When you contact an organization to offer your services as a tech-support person — or in any other capacity — people will be more than happy to accept your offer of help," says Potenza. One of her first volunteer activities was to provide networking advice to a nonprofit association.

Potenza's love of kids eventually led her to the Make-A-Wish Foundation and to her community's Junior Achievement program, where she teaches second-graders about their community. Her employer gives her a couple of hours out of the office for the five-week course she teaches once a year.

"I get a lot of support from Lincoln," says Potenza, vice chairwoman of the company's charitable-giving committee, which provides grants to Syracuse nonprofit organizations involved with the arts, education and human services. ■

Capital Assets

BY PIMM FOX

THE IMPORTANCE of understanding what capital assets are and how they're applicable to your organization can be summed up in four words: the Internal Revenue Service.

How you allocate your information technology budget can depend heavily on how an asset is taxed. And determining whether to buy or lease an asset often depends on how it will be treated for tax purposes.

"An asset that does not have a life of more than one year can be treated as an expense and deducted immediately from a company's income," says Howard K. Warshaw, a partner at New York-based accounting firm Leipziger & Breskin LLP. "These items might include office supplies — the point here is that you can immediately expense these items."

Another way to look at a capital asset: "It is anything not held for sale in the business," says Joseph Clare, a partner at San Francisco accounting firm Clare, Chapman, Storey & Castro LLP.

Depreciating Disk Drives

Capital assets, such as a mainframe computer or a \$10 million storage silo, are typically depreciated over several years instead of expensed as an up-front, one-time charge. Using various depreciation methods, companies can write off the cost of the asset following a schedule produced by the IRS.

For example, the IRS says computers can be depreciated over five years, whereas software purchased separately from the computer can be written off over a three-year period. If you can't separate the software from the hardware, then you must select the five-year schedule, according to IRS regulations.

Rules exist for depreciating different kinds of assets for tax purposes, says Warshaw. Most accountants will use the Modified Accelerated Cost Recovery System, which tells you how to depreciate different pieces of equipment, as some have longer lives than others.

DEFINITION
 Sometimes known as fixed assets, **capital assets** generally are equipment or other items owned by an organization that have a useful life of more than one year. Capital assets include machinery, computer hardware and office furniture.

nature of an asset can get a little tricky if your company is selling capital assets and claiming a loss.

"Some people look to lease certain assets," says Warshaw. "When [you] are signing a lease for tax purposes, the IRS has certain rules as to whether you can expense the lease payment each month."

Of course, the IRS is interested in knowing whether your company is using a lease to purchase something in order to get the interest deduction. One way to make this clear is to have a portion of the contract state that your business can purchase the equipment for fair market price at the end of the lease.

Attempting to buy the equipment for the nominal sum of \$1 won't fly with the IRS. The agency will most likely claim that you purchased the equipment and must depreciate its value rather than deduct the payments.

Maximizing Cash Flows

Another reason to consider leasing equipment is the Holy Grail of cash flow. "Most businesspeople, as well as Wall Street analysts, look for a steady cash outflow from a capital asset," says Clare.

"Everyone wants to manage big expenditures, to smooth out the big capital outlays to avoid big blips in cash flow," Clare adds. "From an economic basis, it could be better for the company. For an IT manager, his or her job is to get purchases or leases organized in such a way so that capital expenses don't bump up all at once."

Warshaw points out that some companies may want to show investors a lot of income, which would favor depreciation of assets over time, rather than expensing them all at once. "If, on the other hand, the company is making lots of money and wants to maximize its deductions up front, it might look to expense the equipment payments each

month. It really depends on your situation," he says.

That's one reason why it's worth doing a projection in December to see if your organization is likely to owe the government a sizable amount in taxes. If so, your company might want to use its cash to purchase office supplies, new stationery or other items that won't last a year so it can receive the immediate deduction, says Warshaw.

"Maybe the write-off is more important this year than the depreciation," says Warshaw. "And your balance sheet will look different, too, the more you capitalize your asset. For technology companies, that might mean capitalizing the interest expense related to the cost of a project."

For example, a company may decide to purchase a large computer or other piece of equipment. By leasing and claiming the deduction of lease payments, it would have a steady amount to deduct from income, smoothing out the company's cash flow.

Then again, depreciation could produce significant changes in deductions from income each year, making cash management more difficult.

The choices come down to a pay-now vs. pay-later scenario.

"For the IRS, a business would want to write off things quickly, getting the deduction, while for shareholders, you would want to show a longer life for your assets," says Clare. ▀

Now vs. Later

CAPITAL ASSETS
Computer equipment
Office furniture
Machine tools
Factory equipment
NONCAPITAL ASSETS
Office supplies
Food for employees
Inventory

Everyone wants to manage big expenditures, to smooth out the big capital outlays to avoid big blips in cash flow.

JOSEPH CLARE, PARTNER,
 CLARE, CHAPMAN, STOREY &
 CASTRO LLP

ery System, which tells you how to depreciate different pieces of equipment, as some have longer lives than others.

Typically, computers are depreciated using what's known as the "double-declining balance" over five years. This is an accelerated method of depreciation that "allows you to write off a higher percentage of the cost in the beginning," notes Warshaw.

Being able to write off a larger portion of an asset earlier in its life can have several effects: It can reduce the amount of income on which the company must pay tax. In addition, by writing off an asset early, your

balance sheet isn't full of assets that aren't generating cash flow. But what if you decide you want to get rid of the computers before the five years are up?

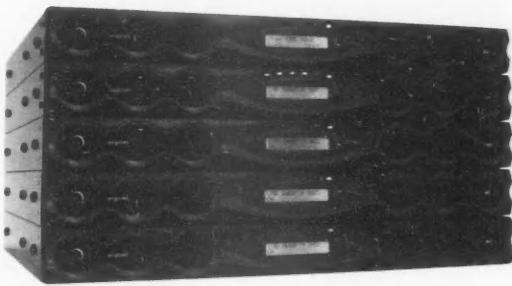

"If you paid \$1,000 for the machine, and you already depreciated \$600 of it after two years and then sold it for \$400, you would be able to recognize a loss of \$600 against your income," explains Warshaw.

In this case, you get the write-off against income using depreciation and you get to deduct the loss of \$600 against ordinary income, thereby lowering the amount that's taxed.

JOE AUER/DRIVING THE DEAL

Good note-taking can go a long way

NEGOTIATION AGENDAS and meeting minutes prepared by your team are important. Make that very important. Your team should develop a formal agenda for every negotiating session with a potential supplier.

The benefits are many: You'll prepare better; you'll be able to control the meeting and the vendor more easily; you'll ensure that the points you want to address are addressed — and in the right order (some points become more or less important if related issues are won or lost); and you'll be able to use your team members more efficiently (group topics so that team members who are specialists in one or two need to be there only when their topics are discussed).

Why should you run vendor meetings? Because you've got what they want — the money.

Failure to record the results of negotiations in a clear and concise manner can lead to disagreement between the parties over what

was actually discussed — or agreed to. The confusion will lead to protracted negotiations — and perhaps mistrust — between the parties. The cure is simple: Make sure someone on your team takes complete and accurate minutes.

It's also useful for scribes to be in on your planned tactics, objectives and team roles. Actually, it's interesting how much the note-taker can control the negotiating session itself. He can request clarifications during a strong bargaining initiative by the other side (to slow its momentum), recall previous points that support your objectives and control the tempo of the interaction. In short, controlling the documentation of negotiation information helps keep the vendor in check.

If the one of the members of the negotiating team is assigned the scribe's role as an ancillary task, the results may be unfortunate for two reasons.

First, the quality of the minutes may suffer because the scribe is more focused on another role in the negotiations.

Second, the scribe's performance as a member of the negotiating team may suffer from a lack of focus.

Having a full-time scribe emphasizes that taking minutes is important and will be done thoroughly.

The scribe should attend every negotiating session to produce and document meaningful results.

To get things started, before or when the negotiating session begins, provide the potential vendors with a ne-

gotiations protocol, which states the following points:

- The customer will provide a meeting agenda and a dedicated scribe.
- Either party may request that the scribe read the notes regarding a particular negotiating point.
- Copies of the minutes will be provided to both parties.
- Discrepancies will be reconciled either outside of formal negotiating sessions or at the next negotiating session.
- The potential vendor may propose issues to be included in the agenda for the next meeting. Notice the control on this point.

The agenda will determine the sequence of the negotiation minutes.

You can have the scribe prepare a minutes template that lists each negotiation point from the agenda. Sub-headings under each point can include "our position," "vendor's position," "discussion comments" and "status" — such as resolution of the issue. Using this format, the minutes provide a clear trail to understanding how the current status was reached.

After each negotiating session, the minutes can be used to update team members who weren't in attendance, update or modify the team's negotiation plan and help develop the next session's negotiating agenda.

The minutes are also very useful in preparing the final contract if they capture specific contract language as it was agreed to during the negotiations. Save all of your notes, since having the negotiation notes along with the contract can be very important later in the event of a dispute. You may want to eventually establish intent, the basis for an agreement or how you were

induced into the agreement.

Most customer teams could improve greatly on preparing for, controlling and documenting each negotiating session. The meeting agenda and minutes are powerful tools.

So get better at determining what's going to happen, controlling what happens and documenting what happens — and you'll see better results. ▀

BRIEFS

Galileo Reports Decline in Bookings

Galileo International Inc. in Rosemont, Ill., last week said its third-quarter computerized reservations bookings were lower than planned, due partly to the continuing shift toward online ticketing, a trend that pulls business away from Galileo's main customers, travel agents. It also attributed the loss to negative effects from flight cancellations by Chicago-based United Air Lines Inc., which founded Galileo and retains an ownership stake of roughly 17% in the company.

However Galileo added that its earnings for the third quarter should still meet expectations — about \$385 million, up 5% from the same period last year. The final results are due to be announced Oct. 23.

Galileo is trying to break into the online travel market through Trip.com, a ticketing Web site focused on business travelers that it acquired earlier this year.

Cell Phone Users Resist Legislation

A recent survey found that while 70% of people agree that driving while using a cell phone is dangerous, most still don't want to see legislation passed that would prohibit the use of cell phones while driving.

The survey of 300 adults, conducted over the Internet Sept. 30 by InsightExpress LLC in Greenwich, Conn., showed that 61% disagreed with legislation, such as an ordinance proposed in Chicago banning cell phone use while driving.

Consortium Explains ASP Contract Basics

The ASP Industry Consortium recently announced a new guide aimed at helping consumers understand application service provider (ASP) agreements. The "End Users Guide to Service Level Agreements" is available through the ASP Industry Consortium's Web site, www.allaboutasp.org. The guide, however, is only a first step for the Wake-

field, Mass.-based group. The consortium said it plans to release a much more comprehensive document to help ASPs develop service-level agreements.

Stamps.com Experiences Exodus

Santa Monica, Calif.-based Stamps.com's CEO, president and chief operating officer, chief financial officer and comptroller all resigned last week. Officials at the online postage services company said outgoing CEO John Payne and outgoing President and COO Loren Smith will both serve on the Stamps.com board of directors.

Payne will be replaced by acting Chairman Marvin Runyon.

CFO John LaValle and Comptroller Candelario Andalon are leaving the company to pursue other interests, according to a statement released by the company.

The price of Stamps.com shares sank to \$2.43 in early-morning trading on the Nasdaq Stock Market Oct. 12, down from a high of \$98.50.

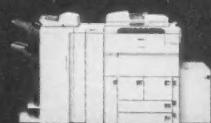

Authoria Names CTO

Authoria Inc. recently named Peter Schilling its chief technology officer. Prior to joining Authoria, a Waltham, Mass.-based electronic communications provider, Schilling served as CTO and vice president of engineering at TradeOut Inc., an online business-to-business Internet marketplace for business surpluses.

JOE AUER is president of International Computer Negotiations Inc. (www.dobetterdeals.com), a Winter Park, Fla., consultancy that educates users on high-tech procurement. ICN sponsors CAUCUS: The Association of High-Tech Acquisition Professionals. Contact him at joe@dobetterdeals.com.

BMW Pilots DSL Video in Plant

Luxury vehicle maker puts broadband video services on the factory floor

BY LEE COPELAND

EVEN IN A STATE-OF-THE-ART manufacturing plant, things break down, production slows to a crawl, and line workers wonder what's up.

Those are a few of the reasons BMW Manufacturing Corp. installed a high-speed Digital Subscriber Line (DSL) network to provide video services at its Greer, S.C., facility.

"Curiosity does not add to attention and quality output," said Bobby Hitt, a BMW Manufacturing spokesman. "We wanted to add to the communication process and make sure that everyone knows what's going on."

To keep its 3,700 plant employees abreast of production targets, quality regulations and line stoppages, BMW Manufacturing last month began piloting an in-plant video sys-

tem. The pilot includes 24 monitors set up in the assembly department and plant cafeteria powered by broadband DSL Internet connections that run over the plant's existing

BMW MANUFACTURING'S in-plant video system will keep 3,700 plant employees informed

copper-wire telephone system.

But the DSL system wasn't BMW Manufacturing's first choice. The exclusive production facility of Munich-based Bayerische Motoren Werke AG's Z3 and X5 Sports Activity Vehicles originally wanted to install a fiber-optic infra-

but it had to park that plan due to "galloping" costs.

"The cost of routing cable into our existing wire trays alone exceeded the budget by over \$100,000," Hitt explained. "And that cost would have been exacerbated further because in our production environment, unlike a house, the installation cannot be done during work hours."

Eric Rasmussen, a senior analyst at TeleChoice Inc. in Denver, said video over the Internet has been problematic because data packets don't always arrive in a timely fashion due to high traffic. But closed-campus environments can avoid those latency problems. "Unlike [the] Internet, which does not have quality controls and relies on best-effort service, in a closed environment like a manufacturing plant, you can prioritize traffic," Rasmussen said.

The DSL system, which cost several hundred thousand dollars to install, offers downstream data transmissions of as much as 4.48M bit/sec. and an

upstream capacity of 972K bits.

BMW Manufacturing developed the pilot system with communications software from Target Vision Inc. in Pittsford, N.Y., and DSL management equipment from mPhase Technologies Inc. in Norwalk, Conn.

Andy McCormick, an analyst at Aberdeen Group Inc. in

Boston, said BMW Manufacturing will also be one of a few companies testing videocasts over DSL. "It's something that companies want to do, but so far, it's been reserved for large businesses with dedicated fiber connections or private cable TV into the business," McCormick said. ▀

Server Aids Web on Run

Translator supports mobile devices

BY LEE COPELAND

Chicago-based Curious Networks Inc.'s middleware, announced this month, aims to make it easier to tap into the Web from PCs and mobile devices and to query databases, officials said.

The firm's server, called a multichannel access platform, acts as a translator between back-end data systems and applications that run on mobile devices, such as mobile phones and Palm Inc.'s handhelds, as well as on PCs. It won't ship until March, but Curious Networks plans to launch a Web site to give developers free access to the software next month.

The Java-based server is built using Multichannel Access Extensible Markup Language (MAXML), a technology developed by Curious Networks that translates queries from various mobile devices into the appropriate standards-based code to extrapolate data from a back-end system. The server also includes a set of interfaces for different device types.

For example, using the MAXML platform, a user could download a corporate Web directory with a Palm and search for a particular individual's name and phone number. If the server was configured to support voice-activated phones, the user could also obtain that same data from a phone without additional changes to the original application.

The Yankee Group, a market research firm in Boston, estimates that 21.3 million users in the U.S. will access data from a mobile device by year's end.

Designing one application that's suitable for a bevy of device formats is a challenge for developers, said Jack Gold, an analyst at Meta Group Inc. in Stamford, Conn. Different screen sizes and data types make transforming information appropriately to different devices very difficult. "For most corporations, it's best to limit your device choices," said Gold.

In the short term, writing applications for devices will remain "tactical, rather than strategic" development projects, he said.

Curious Networks plans to offer its technology as a hosted service and as a stand-alone server. Pricing has yet to be determined. ▀

AT 178 MPPS, WHO CARES ABOUT AERODYNAMICS?

Scaling up to 178,000,000 packets per second of throughput and 480 Gigabits per second of total switching capacity, the BigIron family of Layer 3 switches leaves competitors floundering in its wash. This isn't just a revolution in speed.

It's an evolution in modular design. With scalability of up to 120 Gigabit Ethernet ports, BigIron offers the highest Gigabit density per rack in the industry. And BigIron supports multi-protocol routing including IP, IPX, Appletalk, OSPF, BGP4 and multicast protocol standards. Best of all, the BigIron family protects your investment—all BigIron modules are interchangeable among the BigIron 4000, 8000 and 15000. So if you care about network performance, call Foundry Networks at 1-888-TURBOLAN (887-2652), email info@foundrynet.com or go to www.foundrynetworks.com. We'll get you up to speed.

Big Telecom Provider Turns to Voice Over IP

BY JAMES COPE

WHILE vendors have been touting the benefits of phone systems that send voice over data networks using Internet Protocol instead of over traditional telephone lines, none of the big telecommunications companies have embraced voice over IP for widespread use. Many of them, analysts say, are worried about shelling out more money to deploy and maintain IP-based systems that could cannibalize voice revenue by treating voice calls like any other type of data.

But that changed two weeks

ago when Cable & Wireless PLC in London announced that during the next three years, it plans to migrate all of its European and North American business voice customers from traditional circuit-switched telephone services to voice over IP.

"If we go down that road [run voice over an IP network], I'm going to have to be really convinced that I'll have the bandwidth I need for both data and voice," said Kell Achenbach, director of information services at Sky Courier, a Sterling, Va.-based next-flight-out delivery service and subsidiary of Seattle-based Airborne Freight Corp.

Achenbach said his company uses Cable & Wireless' traditional voice services for customer and dispatcher toll-free phone calls.

\$1.4 Billion Deal

Customer concerns such as Achenbach's may be why Cable & Wireless elected to have Brampton, Ontario-based Nortel Networks Corp. build, implement and manage its network and voice over IP system, said Eric Goodness, an analyst at Gartner/Dataquest, a division of Stamford, Conn.-based Gartner Group Inc. Cable & Wireless officials said their company will pay Nortel \$1.4 billion over the next 10 years.

Cable & Wireless said voice over IP will be rolled out to its customers in Europe and North America first and eventually to Asia/Pacific customers. The company will guarantee voice-over-IP service levels equal to those of standard switched telephone services, Cable & Wireless officials said.

In the new Cable & Wireless network, voice data packets will share bandwidth with other types of data, a company spokesman said.

In some instances, according to experts, voice-over-IP technology can cause delay, echo and a general deterioration of signal quality as packets that make up telephone conversations compete with other network traffic.

One way to get around the problem is to give voice traffic higher priority than other data, said Elizabeth Asher, an analyst at Meta Group Inc., also in

Stamford, Conn. But on networks like Sky Courier's, other types of data are just as important as voice data.

"[Cable & Wireless and Nortel] will probably overprovision the hell out of the network initially. There is no congestion when there's plenty of bandwidth," Asher said. ▀

I'm going to have to be really convinced that I'll have the bandwidth I need for ... data and voice.

Take me to fast, streaming Internet access.

Steven R. Keller - Vice President, Marketing & Content Development, Toddlerwatch. "AT&T provides us with superior networking solutions that enable Toddlerwatch to deliver more than just bytes, bits and data. With AT&T, we now deliver unique experiences to our customers."

Make it live and secure.

Toddlerwatch, a Web-based service that connects parents to their young children through real-time streaming video, needed a scalable network solution with powerful levels of reach, speed and security for its bandwidth-intensive applications.

AT&T Data & IP Services delivered an array of high-speed Internet access including **DSL** and **T-1** connections. **AT&T Managed Internet Services** enables Toddlerwatch to leverage a world-class IP backbone, smart routing capability and continuous performance monitoring. Toddlerwatch now connects thousands of families across the nation with optimum refresh-rate levels and high-quality imaging. If fast, streaming Internet solutions will help your business grow, let AT&T take you there – **now**.

Laptop Security Turns On 65-Cent Solution

High-tech measures give way to simple locks

WAshers — those little circular pieces of metal with a hole in the middle designed to help bolts grip a surface without damaging it — have nothing to do with IT security, right?

Well, I hope they do, because I just persuaded my company to buy 1,000 of them.

We have a fair number of laptops sprinkled around the company, mostly among senior managers and salespeople, and every so often, one of them goes missing. The cost of replacing the hardware is a relatively minor problem, but the data on the laptops is another thing entirely.

Our data may not be quite as sensitive as the data on the laptops at MI6, the British intelligence agency, but it's still quite valuable to certain people.

We're investigating laptop-encryption products at the moment, but in the meantime, we've been trying to find a way to physically protect the laptops to make them slightly less vulnerable to loss or theft in the first place.

Protection Racket

The first thing to do was to buy security cables. These are simple things — wrap the cable around the leg of your desk, then secure one end to your laptop using the lock provided. Of course, nothing is quite this simple in real life, and we've already had to deal with lost keys and reluctant staff. The trickiest problem we've faced with this involves our "deluxe" desks.

These desks, used by senior managers and some of the salespeople, don't have exposed legs, so there's nowhere to attach the security cables. This problem went round and round for a while until it reached someone with enough common sense to solve it — unusually, a very senior manager. Even the deluxe desks have a cable hole in one corner, since everybody in the company uses a computer of some sort.

Security Manager's Journal

The simple solution was to create a metal ring with a diameter larger than that of the cable hole. You attach the security cable to your laptop, pass the cable through the cable hole, then attach it to the ring, which can't pass through the hole. Simple, *n'est-ce pas?*

Unfortunately, it's taken me about three months to get this simple solution put into practice. We spoke to our facilities team, explained the problem and our suggested solution and asked them to sort it out for us.

One member of the facilities team e-mailed back explaining that what we really needed were security cables for the laptops, and he helpfully gave us contact details for a supplier. I explained that we already had cables but needed a way of attaching them to deluxe desks. The facilities person eventually understood the problem and asked us to call the facilities help desk.

He even forwarded his e-mail to the help desk, which responded with a simple answer in a matter of days. The suggestion? "Buy a laptop security cable...."

We explained the situation calmly and patiently to the help desk. In retrospect, the calm patience may have been a mistake, because I'm reasonably sure that a short bout of bad-tempered shouting would probably have got the whole situation resolved much more quickly.

Once they understood the problem, the help desk staffers farmed the job out to the design team. But the designers didn't understand, so we explained it to them as well.

Two days later, I arrived at my desk to find a security cable wrapped round the exposed leg of my (standard-issue) desk and a quizzical e-mail from facilities wondering what the problem was. They failed to understand the problem over the phone and said they would come by my desk and talk it through face to face.

The commonsensical senior man-

er who, unlike me, is actually senior enough to have a deluxe desk, neatly took over the conversation before I lost my temper; he asked the facilities team to try the same trick on his desk. The facilities team eventually conceded the point, understood the whole nature of the problem and resolved to go away and solve it for us.

They came back 10 days later having found a supplier that would create custom laptop-security cable-anchoring devices. They could rush the job through with a brief two-week lead time and charge us no more than \$6.50 a piece.

That was when I finally decided that contacting our facilities team was probably not the simplest method and contacted my local hardware store. Three-inch washers cost about 65 cents each and do exactly the same job.

The High-Tech Approach

Another, slightly more technological mechanism we've used for laptops is the Indsol Tracer System from SmartWater Europe Ltd. in Newport, England. It uses SmartWater, a nonconductive "liquid forensic coding system" that is designed to be different for each SmartWater user customer and to be uniquely identifiable. It's manufactured by the British government's Forensic Science Service, which keeps a database of which batch belongs to whom.

We're starting to paint each of our laptops with this gizmo, so that if any is stolen and then recovered by the police, they should be able to identify it and return it no matter what's been done to it in the meantime.

We're not sure what to do about disk encryption at the moment. Windows 2000 provides file and disk encryption which would do the job very nicely, since it would require no extra software and (hopefully) be neatly integrated with the rest of the operating system. But we're not rolling Windows 2000 out to the users for at least a year.

Pretty Good Privacy (PGP) Version 5 would do the job, but previous experiences with PGP have shown that even though its interface is clear and simple, it's still too complex for some of our staff. We're going to take a hard look at PGP Version 7 in a few weeks to see if it can do the job.

The rest of my week has been spent closing off as many issues as I can be-

THIS WEEK'S GLOSSARY

SmartWater: SmartWater Europe Ltd.'s nonconductive liquid, when painted on objects, provides a unique "fingerprint" that works in a way similar to DNA profiling. Recovered devices can be easily identified by a unique code embedded in the liquid, which the company stores in a central database. The British government's Forensic Science Service manufactures the product under license.

Likable Little Laptops

Our reviewer finds a winner in his ongoing quest for a better, smaller notebook computer. By Russell Kay

KEEP SEARCHING FOR the "perfect" small notebook computer to carry when I travel, and over the past six months, I've tried out a number of machines: Compaq's Armada M300, Fujitsu's LifeBook B Series, IBM's new ThinkPad X20, Toshiba's Portege 3480CT and finally, a couple of ringers, NEC Computers Inc.'s MobilePro 780 and 880 (see "NEC's Small Wonders," top right).

All but the NECs are full-fledged Windows PCs that typically weigh between 3 and 4 lb. in their normal configuration.

That's a basic requirement for this group. The catch: "Normal configuration" means no removable drives; CD-ROM (or DVD-ROM) and floppy disk drives are all external. For the LifeBook and Portege, these drives attach by propri-

etary cables with special connectors on each end. Also, these machines don't have all the standard attachment ports — serial, parallel, video out, Universal Serial Bus (USB), modem, network or mouse and keyboard — on board. Most rely on an external port replicator (usually cable-attached) or put the ports on one of the external disk drives. Both approaches happen to bug me, but you might like one or the other just fine.

Ports and removable drives aside, these are well-equipped machines, with plenty of RAM, big hard drives and high-quality active-matrix displays no larger than 12.1 in., making for very tiny packages indeed.

None of these machines has everything I'd like in one package, though one comes as close as I've seen.

Compaq Armada M300

Compaq Computer Corp.
www.compaq.com
from \$2,599

The Armada clips onto a separate base called a mobile expansion unit, which holds an external CD-ROM, DVD-ROM or floppy disk drive and uses the same power supply, making it a very handy, easily transported package. But the Armada's keyboard is one of the

worst of this bunch, it's dead flat and relatively lifeless in action. The screen has since been upgraded to XGA (1,024- by 768-pixel resolution) over the SVGA-only model I used, and that's a welcome change. Overall, this is one of the most convenient packages in this group.

Fujitsu LifeBook B Series

Fujitsu PC Corp.
www.fujitsu-pc.com
\$1,999

Fujitsu designers decided to take full advantage of this machine's small 10.4-in. screen and made it touch-sensitive, and then they included a stylus that slips into a slot next to the screen. This is a great replacement for a mouse in most applications, and it's faster and more accurate than either a pointing stick (also incorporated) or a touch pad. The main drawback in this arrangement is that the coated screen is slightly less bright than its competitors, and it reflects more ambient light. The keyboard is unfortunately very flat with only a so-so feel, and typing on it was a bit more of a chore than on other machines. This is a nice little machine that a lot of people may find easier to use than other laptops because of the stylus and touch-screen combo.

IBM ThinkPad X20

IBM
www.ibm.com

When I started this review, I had intended to discuss IBM's ThinkPad 240, a tiny, engaging machine with a few drawbacks [Technology, Nov. 15, 1999]. Then IBM launched its successor — which is also the follow-on to the ThinkPad 570 — in which it has fixed all the problem areas and then some. The screen is nearly 2 in. larger and has higher resolution. The

basic machine's titanium-and-plastic body clips into a base that carries a floppy disk drive and has an open bay that will take any of the optical or hard-drive options that fit any of IBM's new A- and T-Series ThinkPads. It has unquestionably the best keyboard of any in this roundup, and it includes something brand-new for laptops: a Compact Flash slot that will take solid-state memory cards or IBM's new 1GB Microdrive. Limited battery life was a problem with the 240, but the X20 has a bigger battery. It comes in two models, and I had a chance to try out both. For me, the Celeron-based model's SVGA screen was a drawback. The top model, with a 600-MHz CPU, 1,024- by 768-pixel resolution, 128MB of RAM and a 20GB hard drive, is the machine I want to travel with. At 3.5 lb. without the add-on base, it's light but easy to see and work with. Other nice touches: a small but adequate lamp that illuminates the keyboard. I also got a chance to use the new low-profile CD-RW drive, and that makes a great combination. The only drawback is the \$2,899 starting price (\$2,199 for the Celeron model).

Toshiba Portege 3480CT

Toshiba America Information Systems Inc.
www.toshiba.com
from \$2,499

This machine frustrated me quite a bit. It's well made — something I've come to expect from Toshiba. The keyboard is flat but has pretty good touch, and it has a pointing stick, which I prefer to a touch pad. The XGA screen is bright and crisp. But overall, instead of being a well-integrated whole, the 3480CT seems to have a zillion separate pieces, almost an assemble-it-yourself kit. I tried the optional high-capacity second battery that slips into a separate base, the notebook clips on, becoming a half-inch thicker and about 2 lb. heavier. The separate DVD-ROM drive I reviewed is more than half the size of the basic computer itself, containing serial, parallel, PC Card, mouse, USB, network, video-out and

NEC's Small Wonders

The NEC Electronics Inc. Mobile-Pro 880 (\$1,099) and 780 (\$899) are ringers. They run Windows CE and have no hard drive. They do have very good color touchscreens and styluses and built-in 56K-bit modems, and they accept removable media in the form of Compact Flash or PC solid-state memory cards. The bundled applications are "pocket" versions of Microsoft Word, Excel, PowerPoint, Outlook, and Internet Explorer.

Though far from full-featured, they are adequate working tools. What sets these machines apart from other handheld PCs in their keyboards, which are close to full-size, with good feel.

Of the two machines, the 880 looks like a "normal" laptop, with its 9.4-in. SVGA screen (similar to the Compaq Aero 800; see Technology, Sept. 13, 1999).

After using both, my choice is the 780. Its half-height screen makes it incredibly portable. It's great for taking along almost anywhere; it won't fit into a shirt pocket but rides handily in just about any kind of shoulder bag or portfolio, and its instant-on operation is superconvenient. — Russell Kay

AC power ports. The power brick attaches via a rubbery connector that seemed flimsy, though it worked the whole time I used it. I liked the computer by itself. But for traveling, when I know I would have to take along the bulky external drive and the battery base, it would be a little too complicated.

My Choices

For general travel use, where I have to pick up Lotus Notes e-mail over the Internet, my choice is毫不犹豫地 the ThinkPad X20. The 12-in. XGA screen and clip-on expansion base make this a great traveler. If I didn't need Notes and could make do with Post Office Protocol 3-based Internet mail, my choice for shorter trips would likely be the NEC MobilePro 780: big enough to do real work on, yet small enough and light enough to take anywhere, anytime. ■

Quantum Leap

As we look beyond the Silicon Age, quantum computing offers up-to-now unimagined speeds, and it's virtually uncrackable as well. By Allison Wright

IMAGINE A COMPUTER with speed previously unheard of, the agility to solve calculations that would stymie a conventional computer and the ability to produce more secure lines of communication.

Impossible in the foreseeable future? Actually, researchers think this type of machine, in the form of a quantum computer, may move out of their laboratories by the end of the decade.

The largest quantum com-

puter built to date, however, is a 5-bit device created by IBM's Almaden Research Center that has been squeezed onto a single molecule.

The concept of using quantum physics to perform simultaneous computations on massive amounts of information has been in the works since the 1980s. It was only about five years ago, however, that quantum computing became a major area of interest to computer theorists around the world.

Unlike a conventional com-

puter, a quantum computer could conceivably process every possible input simultaneously through a series of quantum switches connected in parallel. In effect, it would be the most perfect form of parallel processing imaginable, dealing with information in a way that's impossible for conventional computers, which follow the rules of binary logic — an either/or distinction.

In a binary system, each bit of information is either on or off, one or zero, true or false. A conventional computer strings together combinations of ones and zeros to represent pieces of information, whereas quantum computers are made up of quantum particles such as electrons and atomic nuclei. Each particle represents a quantum bit, or qubit.

Qubits differ from conventional bits in that an atom or nucleus can be in a state of "superposition," acting as both a one and a zero simultaneously. Quantum computers take advantage of the behavior and properties of atoms to potentially provide switching and processing speeds millions of times faster than those of today's supercomputers.

For example, if you have two qubits, they could simultaneously exist as a combination of all possible two-bit numbers: 00, 01, 10 and 11. Add a third qubit, and you could have a combination of all possible three-bit numbers: 000, 001, 100, 110 and 111. This system scales exponentially: n qubits can stand for 2^n numbers at once. Line up a mere 50 qubits, and you could represent every binary number from zero to more than a trillion — simultaneously.

Overcoming Obstacles

A major obstacle that researchers face in developing quantum computers is making sure the qubits retain their superposition of being both — or either — a one or a zero. Observation of a quantum computer allows an outside interference such as light or noise to exert some influence over the qubits, forcing them to collapse and leaving an ordinary computer based on ones and zeros.

In order to allow quantum states to store information, a quantum computer can't interact with its environment. But at the same time, it has to be ma-

nipulated to allow calculations to be performed.

"Reliability is a serious factor for quantum computers. We need to devise ways of coding information so that qubits will not be affected by the environment — a fault-tolerant effect," says John Preskill, a professor of theoretical physics at the California Institute of Technology in Pasadena, Calif.

Quantum computers hold great promise in the area of cryptography. The transmission of encrypted data over fiber-optic communications using single photons (packets of light) could be used to foil code breakers. Qubits can't be copied or cloned, so it would be virtually impossible for a hacker to break code encrypted with a quantum computer.

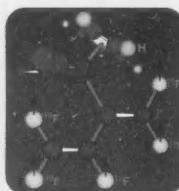

On the other hand, "if a hacker possessed a quantum computer... security would be threatened because he or she would be able to break the codes of conventional computers," says Preskill.

Carl Williams, a physicist at the National Institute of Standards and Technology in Gaithersburg, Md., and Umesh Vazirani, a professor of computer science at the University of California, Berkeley, say absolutely safe lines of communication will require a quantum repeater.

A quantum repeater would allow the photon being transmitted over optical fiber to be repeated without being disturbed. The repeater would allow the photon to be transmitted another 50 km. For this to work, the photon would need to be duplicated in its superposition (the pair of complex numbers describing its position).

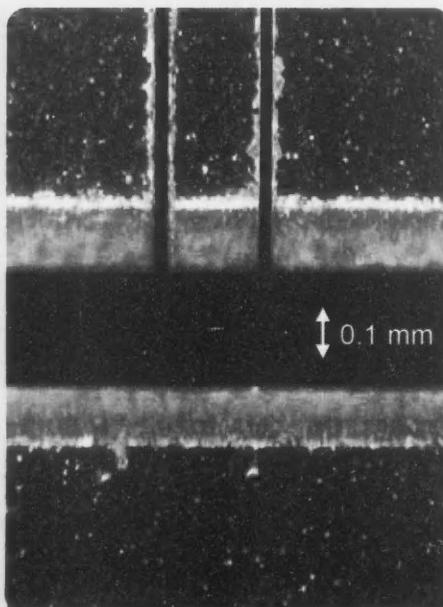

"A quantum repeater is possible in principle, and scientists are trying to make it happen. The main challenge is that the repeater must be a quantum device — some kind of quantum switch, since any measurement of the photon would reveal only a very small amount of information about the quantum state of the photon," says Vazirani.

Scientists need time to work through the challenges of quantum computing, including the development of a computer with capacity of 50 qubits or more, but the important first steps toward that goal are currently under way, according to Vazirani.

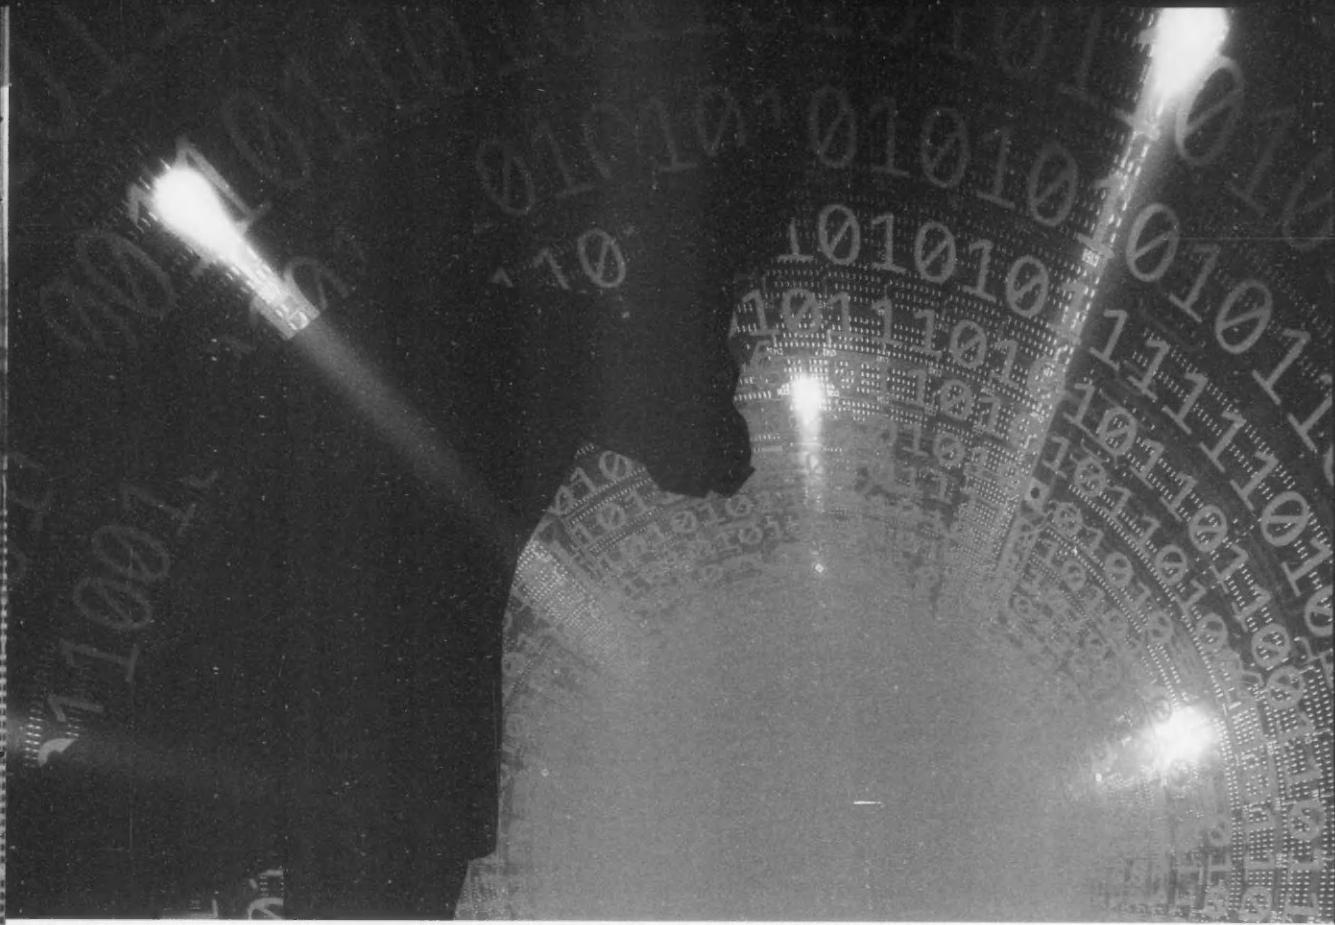

The Power Of Quantum

The molecule diagrammed above is the world's most advanced quantum computer. Each of the five fluorine atoms can act as a quantum bit, or qubit, to solve mathematical problems. At right, a metal electrode structure holds five beryllium ion qubits (the white dots at the center of the electrode structure). When this "accumulator" is illuminated by laser beams, rudimentary quantum logic operations can be carried out between the ion qubits.

NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY, BERNSTEIN, ZOLLO

Don't be mystified by SAN solutions. The choice is clear.

BROCADE

Combining award-winning Fibre Channel switches and SAN management software, Brocade solutions provide scalability, simplified storage management, system interoperability, and availability. Brocade partners with major storage and systems OEMs and Integrators to provide SAN solutions optimized for LAN-free and serverless backups, storage and server consolidation, disaster tolerance, and high-availability applications. It's no wonder that Brocade is the industry leader—and the clear choice—for SAN solutions.

Just ask the judges at NetworkWorld, who recently gave the Blue Ribbon Award for best product to Brocade SilkWorm switches. Visit www.brocade.com and click on the award to learn more.

Asking the right questions up front can mean the difference between a dream relationship and a nightmarish one. By Gary H. Anthes

IT WAS AN E-COMMERCE MANAGER'S WORST nightmare. The OshKosh B'Gosh Inc. online store appeared open to customers — they could place orders — but the orders went nowhere. The communications link between the clothing retailer and the company hosting its Web site had gone down.

But the nightmare was just beginning. The Oshkosh, Wis.-based company struggled for several days to re-establish contact with its Web server at Digex Inc. in Cupertino, Calif. "The [Digex] facility was secure, and they wanted a two-day notice before anybody could get into it," says Jon Dell'Antonia, CIO at OshKosh. "But how are you going to notify them two days before you have a failure?"

Dell'Antonia's problem was further complicated because OshKosh's outsourcing contract was with Sunnyvale, Calif.-based application service provider (ASP) Pandesic LLC, which had, in turn, subcontracted with Digex for the hosting site and servers. And it was a fourth party — OshKosh's telecommunications carrier — that needed to get into the Digex site to repair equipment.

"It was like the Three Stooges and the Keystone Cops combined," Dell'Antonia says. "If I went through the whole litany, you'd be rolling on the floor laughing. But we were not laughing at the time."

The lessons are clear for information technology managers: If you don't ask the right questions up front, you risk paying the price later. Fortunately, managers contemplating moving to an ASP can learn from the experiences of veteran users.

Measure of Success

The Motley Fool Inc. in Alexandria, Va., outsources the running of its payroll, budgeting and other financial systems to USinternetworking Inc. (USi) in Annapolis, Md. Kevin Book, senior director of technology at The Motley Fool, says his own IT experts "went on-site and really put them through the wringer," especially on issues of security, system availability, capacity for growth, data redundancy and technical support.

But The Motley Fool's interest in USi's technology went only so far, Book says. "On their hardware and software platform, we were relatively agnostic," he says. The bottom line for all the questions put to USi was "availability," and The Motley Fool's contract with USi contains quantitative service-level agreements (SLA) and penalties, he says.

If the ASP industry were a mature one, users would just need to specify service levels in their contracts and let it go at that, says Audrey Apfel, an analyst at Gartner Group Inc. in Stamford, Conn. "But it's an immature market. Half the ASPs are going to fail, so you better spend time placing a good bet," she says.

Apfel says customers often concentrate on the *A* in ASP — the application that will be provided — but they should focus more on the *S* — the service component. "The thing that's important is the people," she says. "Ask them how they hire, train and retain staff. When they have turnover, how do I know that expertise I need is not walking out the door?"

Apfel says performance guarantees and penalties are important, "but if there's a metric in your SLA you can't audit, it's not very useful." Audit tools could include users' own record keeping, reports from the ASP or automated, real-time Web monitors. Jay Robertson, vice president of data center operations at USi, says users should ask, "You say you are going to provide 99.9%, but how are you going to measure it, and what does it include?"

Business vs. Technology

Another mistake some users make is bringing their application specialists but not their technical or operations people to meetings with prospective ASPs. When that happens, USi recommends that the potential customer bring more technically savvy people to the next session, Robertson says.

Some users forgo the nitty-gritty technical analysis and simply count on being able to leverage their clout with the ASP during the course of service.

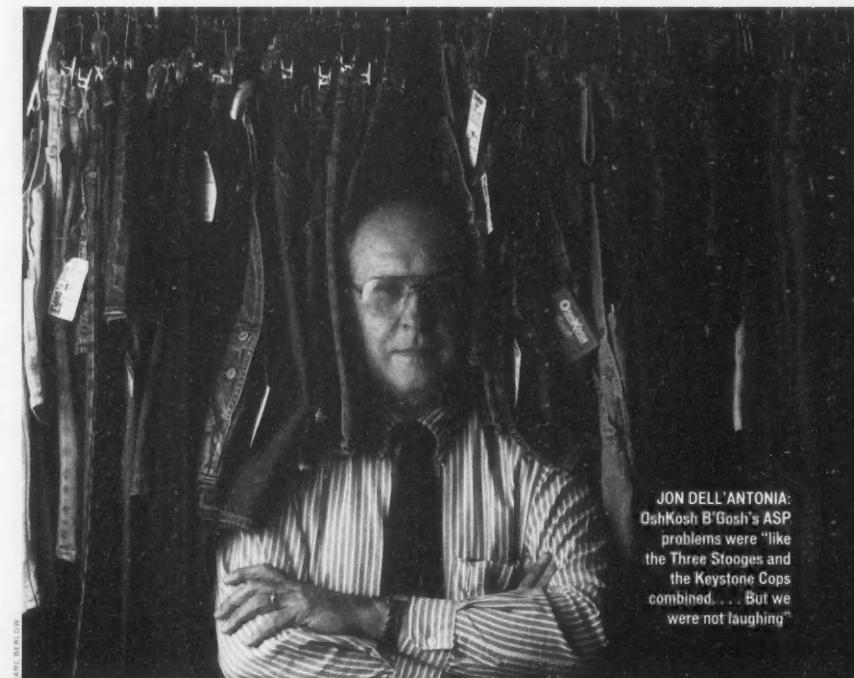

Clifford Macaylo is the supply-chain vice president at Fischbach & Moore Electric LLC in New Providence, N.J., which has contracted with Cephren Inc. in Palo Alto, Calif., for procurement and project-management application services. He says he doesn't

insist on performance guarantees in his contracts, because most ASPs are so new to the game, they will do anything to get and hold on to customers. "It's easy for me to get extremely top-level service," he says.

But didn't he check out Cephren in advance regarding things such as security and data backup? "I have to assume that with today's encryption and firewalls, that if they can't figure it out, I sure as hell can't figure it out," he says.

Half the ASPs are going to fail, so you better spend time placing a good bet.

AUDREY APFEL,
ANALYST, GARTNER GROUP INC.

JON DELL'ANTONIA:
OshKosh B'Gosh's ASP
problems were "like
the Three Stooges and
the Keystone Cops
combined.... But we
were not laughing"

MARC BERLIN

TECHNOLOGY

"Far and away, the most important thing is to get reference accounts," says Art Williams, an analyst at Giga Information Group Inc. in Cambridge, Mass. Next comes the suitability of the application and the financial viability of the ASP; technical considerations are way down the list, he says.

ASPs "tend to be long on technical depth and short on business sense," Williams says. "The field is full of techies who really know what they are doing." He advises, however, that customers ask for a user advocate — "a single person within the ASP who's measured on keeping the customer happy."

Customization Counts

Like Fischbach & Moore, eVinyard Inc. in Portland, Ore., is similarly blasé about technical details such as an ASP's backup, recovery and security procedures. "These things are a basic entry point," says Michael Osborn, vice president of sales and technology at eVinyard.

eVinyard is another Pandescic alumnus in search of a new ASP, and the online wine merchant is likely to go with Intel Corp.'s Intel Online Services (IOS). Osborn says. The ASP is attractive, he says, because of its "world-class network-operations centers," its intimate knowledge of SQL — on which eVinyard's applications are based — and the around-the-clock on-site presence of Intel technicians and representatives of major hardware and software vendors. Osborn says that by clustering redundant computers and disk drives, IOS can offer a 100% uptime guarantee.

But what's most compelling to Osborn about the service, he says, is Intel's ability to tailor its problem response to customer specifications. "They will do anything we say in response to a logged activity such

as an error message," he says. "For example, we may just want them to notify us when a server is down — just make a phone call. In other cases, we may want them to do everything they can to get it back up."

This kind of flexibility is critical in a rapidly growing and evolving electronic business, Osborn says. "We know their procedures, and they can be modified collaboratively. It's the ability for us to access — and help build — the run book for every discrete process," he says.

Dell'Antonia at OshKosh B'Gosh says he will make sure he thoroughly understands his next ASP's run book. "Something we'll be asking for this time is for them to define staffing levels in the [hosting facility] and how they really operate it," he says. "Do you actually have people there physically all the time, and how quick can we get someone in there if it's a problem you are not going to work on?" And he says he will insist on the right to make surprise visits to the ASP's data center.

Dell'Antonia says he will also ask more probing questions about the spare parts and equipment that are kept on-site, the average time it takes to make repairs and the location of repair people.

Gartner Group's Apfel says that's precisely the right approach. "The biggest pitfall is assuming the ASP offers what you need, when what they are offering is whatever they cooked up in the bar the night before," Apfel says. "They are going to try things. ASPs' business models are changing week by week."

Apfel advises users to carefully examine and document their needs before going to an ASP. "It doesn't matter what's in the contract they hand you," she says. "Make sure you have your own independent list of exactly what you need." ▶

Ten Questions To Ask an ASP

1 Will you provide at least three reference accounts that can tell us about your technical and service capabilities?

2 What level of system availability do you guarantee, and how do you measure it? What penalties will you accept if you fail to meet that goal?

3 What provisions have you made for security, data backup and disaster recovery?

4 What are the capabilities and certifications of your technical-support operations and employees?

5 What are your hiring and training practices? And what strategies do you have for retaining your technical people — and their knowledge of my needs?

6 What levels of personnel are at the hosting site? When are they there? And how quickly can we get access to the site?

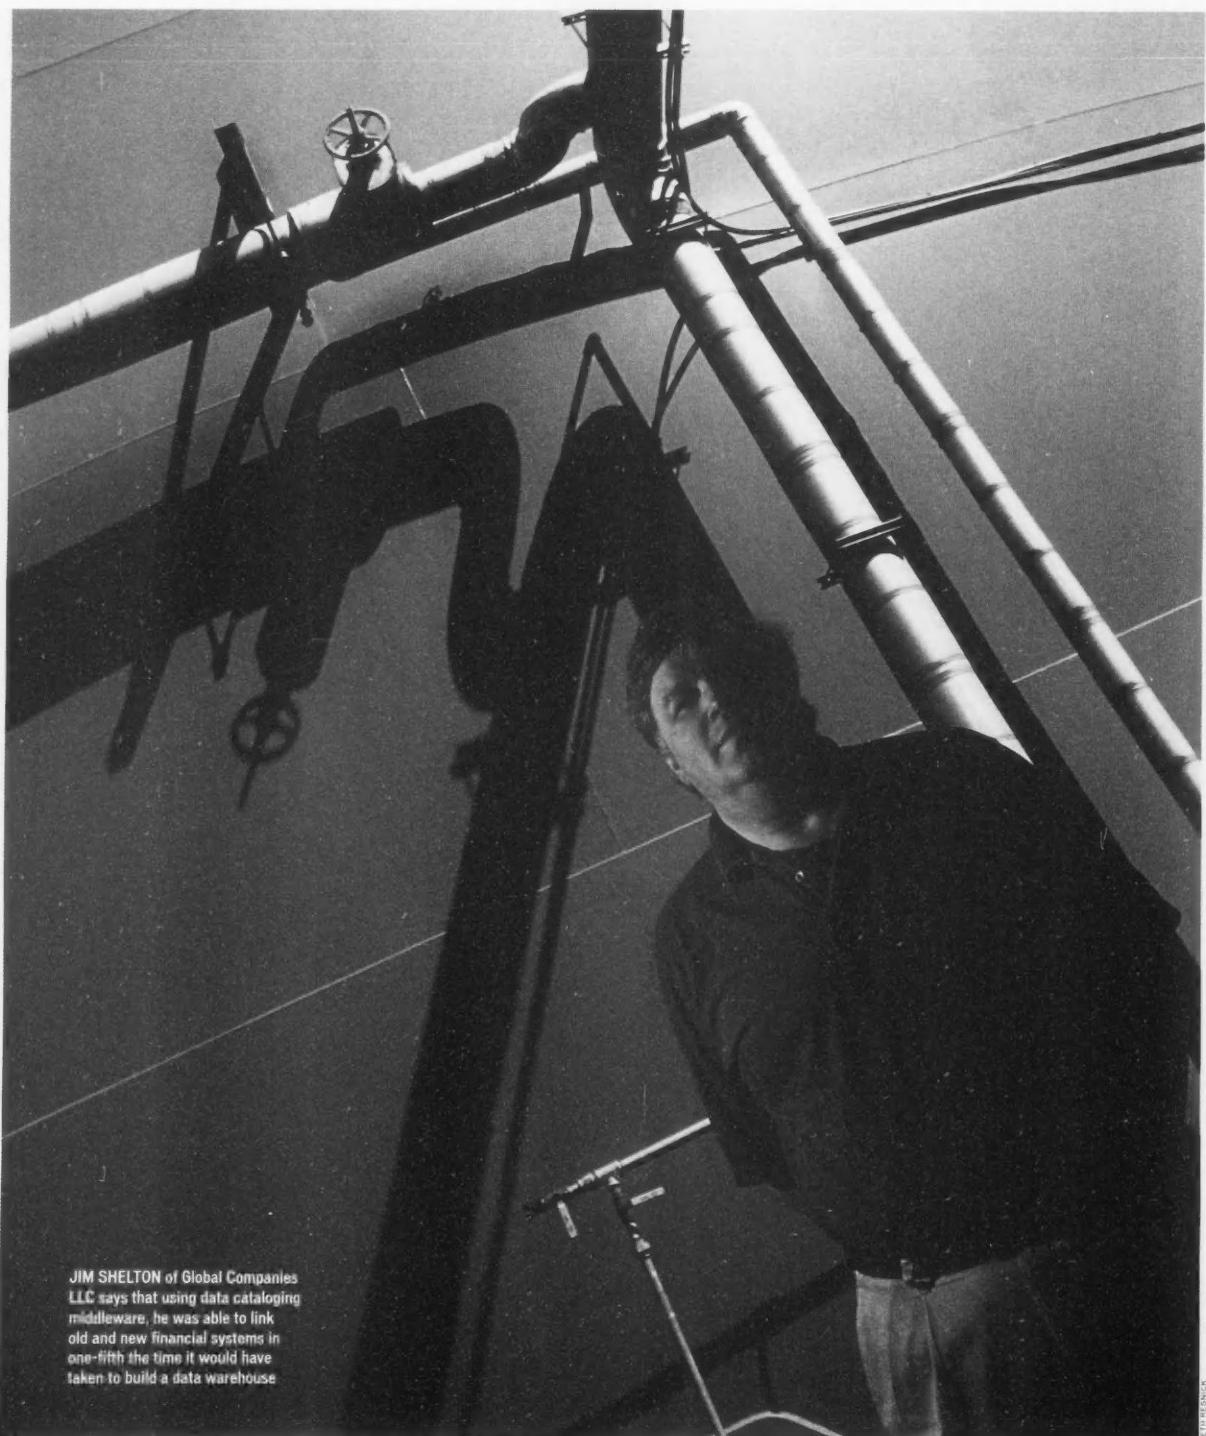

7 What plans have you made to add computer and network capacity, and how quickly will you provide it?

8 To what extent can we help write your run book to tailor your response to problems and events?

9 What are your equipment repair capabilities, procedures and time frames, and what spare parts do you keep on-site?

10 Will you assign a customer advocate and a technical liaison to our account?

AVOIDING ASPANGST

JIM SHELTON of Global Companies LLC says that using data cataloging middleware, he was able to link old and new financial systems in one-fifth the time it would have taken to build a data warehouse.

SETH REINICK

TECHNOLOGY

JIM SHELTON looked the data-warehouse monster in the eye and blinked. And he says he's glad he did. In late 1998, Shelton, the director of information systems at Global Companies LLC in Waltham, Mass., says he considered building a data warehouse to share data between the Lawson Software financial applications his petroleum-distribution firm was phasing out and the new Oracle Corp. financial applications it was embracing.

But he says he knew how expensive and time-consuming it could be to pluck just the data his users needed from the proprietary flat-file database associated with the applications from Minneapolis-based Lawson and to move that data to a data warehouse in a form that could be accessed by the newer Oracle relational database. In addition, updating all that data fast enough to reflect volatile shifts in petroleum pricing and inventory would be a logistical nightmare.

By using a new type of middleware — call it data cataloging — to link the two systems, Shelton figures he's spent one-fifth of the time it would have taken to build a data warehouse. What's more, "Within a couple of days, we were producing data and producing reports that did joins between the Oracle data and the mainframe," compared with the months or years it would have taken to build a data warehouse.

Shelton used Metagon Technologies LLC's DQbroker, one of a growing number of tools that sidestep the cumbersome, time-consuming and politically charged process of extracting data from live production databases and storing it in warehouses where it can be queried and analyzed. Rather than moving the required data to a physical warehouse, software such as DQbroker creates a "catalog" of the data and lets users "order" just the data they need when they need it.

Share and Share Alike

Sharing data among incompatible databases is important enough when, say, accounts receivable needs a daily update from sales to send out the bills or when accounting needs sales data from four subsidiaries to close the quarterly books. It becomes even more important when companies need to buy and sell instantly over the Web.

While different vendors take different approaches, the aim is to let business users find the data they need in a data catalog and order it. The catalog consists of metadata about a database — identifying a data source, describing which tables and columns are available to be queried and even details such as

the data-warehouse monster in the eye and blinked. And he says he's glad he did. In late 1998, Shelton, the director of information systems at Global Companies LLC in Waltham,

Calling All Data

For years, IT managers have searched for ways to give users any data they want, anytime they want it, from any database. With some new tools, that dream is coming closer. By Robert L. Scheier

whether customers are identified by number or by a string of text such as a name.

The metadata is used to direct queries to the proper database and translate queries into the specific format the target database can understand. While some data still must be moved from production databases to users and some may be stored along with the metadata catalog, this approach is often less expensive and time-consuming than building and re-stocking a full-fledged warehouse.

Peers Helping Peers

While most middleware tools create a central hub to catalog information and translate among the various database dialects, Matthews, N.C.-based Metagon scatters these functions among object brokers, one of which runs on every database platform in the

system. Each broker is a peer, meaning it can do data-retrieval work for other nodes or ask other nodes to retrieve data for it.

By dividing up the jobs, DQbroker works more quickly than competing approaches, delivering small amounts of data from some nodes to the user while other nodes are still performing their queries, says David Brower, director of research and development at Metagon. This approach also reduces the amount of data moving over the network, he says, making it easier to scale the system by simply adding more brokers to a single node or creating new databases with an associated broker.

Perhaps Metagon's most important claim, though, is its ability to provide seamless access to any database, from mainframe Cobol applications to popular relational databases such as those

of Oracle Corp. and Sybase Inc., and even Excel spreadsheet files.

Once installed on the database, the broker begins collecting information about the associated database and maintains that metadata locally. It also translates queries between database formats, says Brower.

How well does it work? Well enough that Shelton was able to link not only his Unisys Corp. and Oracle databases, but also a database server from Sybase in Emeryville, Calif., and an in-house custom application for less than \$100,000. It took three days of consultant time to get the links up and running. Shelton's needs are fairly modest: a maximum of 15 concurrent users, accessing several hundred predefined reports processed each night. But the process of giving users access to new tables using DQbroker "is almost akin to drag-and-drop," he says. "When we

Calling All Data

look at places where we need to do integration between systems, we look at DQBroker first."

Getting Attuned

The same challenge confronted an information technology manager at a large distribution company. The IT manager, who declined to be identified, needed to link a legacy Cobol enterprise resource planning system running on a Tandem Computers Inc. fault-tolerant computer with a new SAP R/3 implementation running on an IBM AS/400 and DB2.

"When you run an [inventory-based] business, you need to keep your systems in sync" during such a transition, says the manager.

His company also needed timely information so it could do business over the Web, giving its partners browser-accessible updates about such things as order status. As for data warehouses, the manager snorted, "We don't have time to sit down and redesign a data warehouse for [every] special need" identified by business managers.

After considering several approaches, including IBM's MQSeries messaging middleware and Microsoft Corp.'s BizTalk server, the IT manager chose Attunity Connect from Attunity Inc. in Burlington, Mass., formerly ISG International Software Group Ltd., which had sold the product as ISG Navigator. He says he was sold on the combination of Attunity Connect, the "plumbing" to link the actual databases, and Attunity B2B software, which holds the business rules that determine how data is transformed between the Tandem and R/3 systems.

MQSeries lacked the extensive business-rules engine that Attunity B2B offered, and it wasn't as compatible with other platforms as Attunity, says the manager. BizTalk lost out, he says, because "it's Windows-oriented" and would require a lot of extra development to meet his needs.

The manager says he planned to complete prototype over the summer and launch a pilot system this fall. His biggest surprise so far? "That we found a product that can connect and talk to all those different technologies in a really, really easy way," he says.

Garlic, Anyone?

Don't look for Garlic in any IBM product list — it's middleware technology built into Version 7 of IBM's DB2

No More Data Warehouses?

Instead of moving corporate information into a special warehouse, data catalogs list the data available to users and let them "order" what information they need.

DATA WAREHOUSING

► Actual data needed to answer queries must be moved and stored in a dedicated data warehouse, an expensive and time-consuming process:

DATA CATALOGING

► Data catalog and associated middleware can process queries without the need for a dedicated data warehouse:

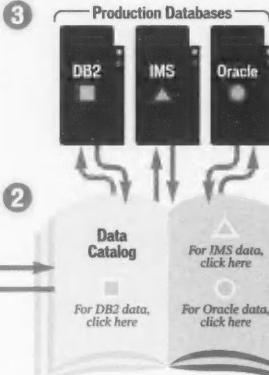

KEY: → BLUE ARROWS INDICATE PATH OF QUERY

database and Version 2 of its DataJoiner database-connectivity software.

In Garlic, the metadata catalog takes the form of "wrappers" — software that describes the data in the remote database, translates commands between the DB2 query engine and the target databases and helps the query engine determine the fastest way to execute the query.

Because the wrappers also know how each database processes queries, such as the number of tables that can be accessed per query, DB2's query-processing engine "can decide the best way to process that request," says Jim Klewein, a member of the senior technical staff at IBM's Silicon Valley Laboratory in San Jose. Like other competing technologies, Garlic can also cache some of the data itself to speed the retrieval process.

Currently, within DB2, IBM provides

A Crop of Data Catalog Tools

Attunity Inc.'s Attunity Connect:

Application-level middleware aimed at synchronous (real-time) information sharing. Provides metadata catalog and native links to target databases for greater performance and flexibility.

IBM's Garlic: Database middleware available only in IBM's DB2 Version 7 and DataJoiner Version 2. Uses "wrappers" to describe data types and specific database implementations to the DB2 query engine. IBM claims Garlic does better query optimization than competitors. Limited support for databases other than DB2 and Oracle.

Metagon Technologies LLC's DQBroker: Peer-to-peer, object-oriented middleware distributes metadata storage, query translation and query processing among "nodes" on each database. Metagon claims that it can access any data from mainframe Cobol applications to Excel spreadsheets.

Oracle Corp.'s Transparent Gateways:

Based on Attunity Connect, the gateways support access to more than 40 non-Oracle data sources including DB2, Sybase and Microsoft SQL Server. Among other functions, the gateway translates queries among SQL dialects and caches frequently used queries for greater performance. Built into Oracle8i.

Sybase Inc.'s Enterprise Connect Data Access:

Provides a catalog of data and application objects available within the enterprise. In addition to accessing data, users can launch applications and stored procedures from the catalog. Because of the object-oriented nature of the catalog, Sybase claims, developers can work with the objects using a variety of development tools including C, C++ or Java.

SOURCE: INTERVIEWS WITH COMPANY OFFICIALS

wrappers only for its own DB2 database and Oracle. With DataJoiner, users can view several other relational databases, says Laura Haas, a research manager at IBM's research center in Almaden, Calif. In the next major release of DB2, expected sometime next year, many of the data-access capabilities now found in DataJoiner will be incorporated into DB2, she says.

For now, IBM is doing most of the wrapper-writing itself, as with its Discovery Link package of products and services for helping scientists track and categorize human genes. IBM also plans to publish an application programming interface to let outside developers write their own wrappers.

If Garlic is currently limited in its support for outside databases, its strength "is the extent to which the wrapper participates in the query-planning process," says Klewein, "and

the extent to which our wrappers have correctly modeled the behavior of the underlying [data] sources."

As a result, says Haas, "We do a much better job of query optimization than any of the competition."

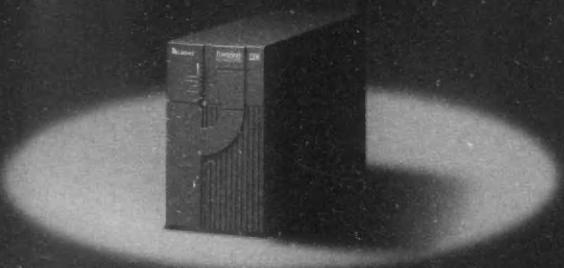

For business users, though, the real value of these new tools lies in that they let business users analyze their data with off-the-shelf query tools, without having to know or care where the data resides. Which is just what Shelton and other IT managers say they want. ▶

Small-scale UPS quality that makes you say, "Wow."

A pricetag that makes you say, "How?"

PowerSure Direct

The experts who brought you 1,000,000 hours MTBF UPS reliability have found a way to reduce the price you'd expect to pay for a small-scale UPS by up to 20 percent. How do we do it? It's simple – we allow you to buy manufacturer-direct through the Liebert website.

And while the pricetag is low, the quality is not. The expertise that has made Liebert an industry leader in 3-phase power protection for over 30 years has been engineered into our 300-2200 VA PowerSure UPSs. You can get a full-featured UPS, with 12 minutes back-up battery at typical load, buck and boost voltage circuit, and multiple outlets for clustered equipment. You're also backed by Liebert's worldwide support and service.

That's how we put the wow in each PowerSure UPS. Visit www.liebert.com for complete product specification and ordering information.

IP Multicasting

BY PETE LOSHIN

IN THE WORLD of Internet Protocol Version 4 (IPv4), you can send data packets to three different types of destination addresses: unicast, broadcast and multicast. The majority of Internet traffic today is unicast, meaning that an address targets a single destination host. In other words, if you send a packet to that address, it will be received by a single computer.

There are also broadcast addresses, which are, by IP convention, interpreted to mean "all hosts connected to this network" rather than to any single host. Send a packet to a broadcast address and it will be delivered to every host connected to the network specified by the address.

Unicast is great — it's what lets you connect your browser to your favorite Web sites, download files and do most of what gets done on the Internet. But it tends to be limiting — you can communicate with only one host at a time. Operators of a Web site providing streaming video might prefer to send out those streams once and have lots of people receive them, instead of managing the overhead of sending out a separate stream to each viewer.

Broadcast might seem to be a good solution, since your packets get sent out only once and could, in theory, be delivered to every host on the Internet, but in practice, broadcast solutions are generally frowned upon. Back in the early days of the Internet (the late 1970s and early 1980s), broadcast was thought to be a good way to propagate network information. But broadcasts crowd out other kinds of traffic, even when they're used only on a single network or subnet; all-Internet broadcasts were ruled out early on.

To get your packets to many recipients, IP multicasting is the way to go. IPv4 Class D addresses (those with values in the range of 224.0.0.0 through

DEFINITION

IP multicasting is a method of delivering a single packet, sent only once by the source host, to multiple destination hosts that may be connected to scattered subnets.

239.255.255.255) are reserved for multicast use. Each address can be associated with a multicast group. To receive data sent to that address, you must join the group. This also works for many-to-many communications, since every group member can originate packets.

Becoming a Member

To join a group, notify your nearest multicast-enabled router, which puts you on its list of group members. When the router sees a packet addressed to your group's multicast address, it forwards the packet to you and anyone else in the group served by that router.

Routing IP multicast packets makes unicast routing — get-

ting a unicast packet from its source to its destination, across a constantly changing landscape of interconnected networks — look like child's play. The idea is to try to minimize duplication, which wastes bandwidth, while also ensuring that all members of the group get all the multicast packets. And, of course, those packets should all be delivered in a timely fashion.

Implementers have been working on scalable multicast-routing solutions for years. Multicast-routing strategies depend on whether the distribution of group members is dense (where most network hosts are multicast group members) or sparse (where most hosts aren't multicast group members).

The basic strategy for dense-mode multicast routing is "flooding": All multicast-enabled routers receiving a multicast packet just retransmit the packet on all their networks except the one from which they received the packet. This way, all routers eventually see all multicast packets. Of course, this approach presents scalability problems because it generates a lot of traffic.

The basic strategy for sparse-mode multicast routing is to avoid sending routers multiple copies of the same packet and to try to send multicast packets only to routers that serve group members.

Not Quite Perfect

Multicasting does have some drawbacks. It's connectionless, which means you can't easily set up reliable streams of data, such as with Transmission Control Protocol. Multicasting uses the less-reliable User Datagram Protocol by default.

The biggest problem is that few Internet service providers are set up to handle multicast packets, which is a shame, since multicasting can enable so many interesting applications.

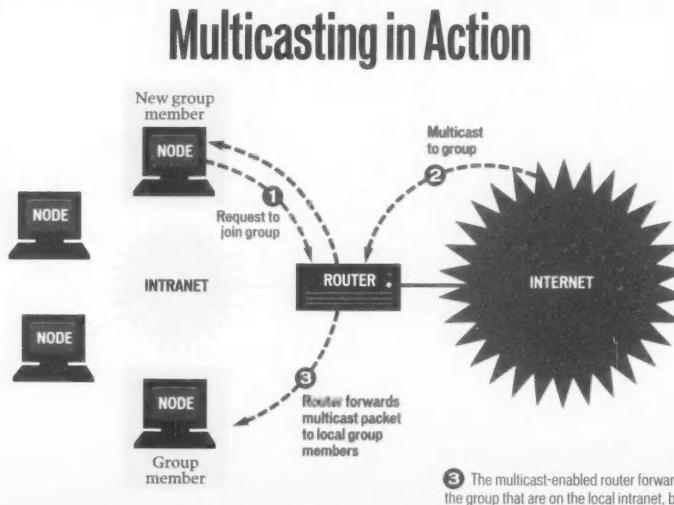

For example, the Internet Engineering Task Force has long used the Mbone — a multicast backbone — to broadcast its events. Multicasting can also reduce some of the overhead associated with voice and video-conferencing across the Web.

The IP Multicast Initiative (IPMI), a self-described "worldwide, multivendor forum accelerating the adoption of IP Multicast," lists providers that offer multicast services. The short list includes leading providers such as AboveNet Communications Inc. in San Francisco, UUNet Technologies Inc. in Ashburn, Va., and Sprint Corp.

Though not yet a runaway success, multicasting still has great potential. According to a white paper published by the IPMI, Intel Corp. began using multicasting in 1996 to transmit events such as product announcements and demonstrations. At the same time, Microsoft Corp. started to make executive speeches as well as local radio, MSNBC and BBC broadcasts available via multicasting. ▀

Loshin is a freelance writer in Arlington, Mass.

This figure shows the Internet on the right and an intranet with a multicast-enabled router on the left. The router is connected to the intranet and the Internet. The intranet contains several hosts, one of which is already a member of a multicast group; another is about to become a member of the group.

1 This arrow links a node that isn't already a member of a multicast group and the local multicast-enabled router. The packet sent is a request to be included in the group, sent to its local multicast-enabled router.

2 A packet arrives at the local multicast-enabled router from the Internet, addressed to that multicast group.

3 The multicast-enabled router forwards the multicast packet to both members of the group that are on the local intranet, but not to any other nodes on that network.

WWW.WIRELESSKNOWLEDGE.COM
A MICROSOFT AND QUALCOMM COMPANY

Start-up ViaFone.com Gives Sites a WAP

Company offers fast installation of wireless application support for Web sites

BY AMY HELEN JOHNSON

GEETING A wireless application up and running quickly is the specialty of application service provider (ASP) ViaFone.com Inc. in Redwood City, Calif. And speed was what John McDowell, chief technology officer at Santa Clara, Calif.-based mySimon Inc., wanted.

MySimon is a buying guide for Internet shoppers — what to buy and where to buy it online. It has a large Web site that dishes out this information on demand. The flaw in that design, explains McDowell, is "the vast majority of the users are not at their PC when they make a buying decision."

Fast Action

McDowell wanted a wireless application that would put mySimon information on cell phones and handhelds, serving those shoppers who are standing in the middle of Baby Gap wondering, "Hmmm, can I get rompers for less on the Internet?" And he wanted it fast.

ViaFone delivered in five weeks, McDowell says. A Web address, <http://wap.mysimon.com>, sends visitors to ViaFone's servers. ViaFone caches the main pages of mySimon.com and the site's hierarchy. When queries come, it sends an HTTP request to mySimon, accepts XML data in return, then converts it into an appropriate format for the user's wireless device. ViaFone includes support for BlackBerry handhelds from Waterloo, Ontario-based Research In Motion Ltd. and Palm OS handhelds.

Wireless applications have a strong future. International Data Corp. (IDC) in Framingham, Mass., projects a 9.3% compound annual growth in the use of smart phones. Also, by year's end, all digital phones shipping will support the Wireless Application Protocol

(WAP), according to IDC.

ViaFone CEO Bernard Desarnauts says what made mySimon's five-week time frame possible is that ViaFone has an integrated set of development tools and delivery services that understand the ins and outs of various mobile device interfaces and wireless bandwidth

considerations as well as how to communicate with back-end business applications like enterprise resource planning and customer relationship management packages.

ViaFone is set up so that someone with knowledge of only markup languages can design a wireless application, says Desarnauts. "We want to minimize the resources to build, deploy and maintain wireless applications," he says.

An advantage that ViaFone

VIAFONE CO-FOUNDERS (from left) Bernard Desarnauts, Josh Stein and Fernando Ruarte

ViaFone Inc.

Location: 2000 Bridge Parkway, Suite 203, Redwood City, Calif. 94065

Telephone: (650) 413-5550

Web: www.viafone.com

The technology: Wireless application service provider and development platform

Why it's worth watching:

The service is fast to implement and works with many wireless services, back-end systems and data connections.

Company officers:

- Bernard Desarnauts, CEO and co-founder
- Josh Stein, vice president of business development and co-founder
- Fernando Ruarte, vice president of engineering and co-founder

Milestones:

- September 1999: Founded
- May 2000: ASP launched

• Sept. 2000: Development product released as beta

Employees: 62; 105% annual growth rate projected

Burn money: \$11 million from Draper Fisher Jurvetson and Partech International Inc., plus angel funding

Products/pricing: ViaFone OneBridge Mobility Platform (in beta); starts at \$100,000

Services/pricing: ViaFone Mobile Application Server; starts at \$150,000 per year

Customers: mySimon.com, CDnow Online Inc., Ticketmaster Online-Citysearch Inc.

Partner: iXL Inc.

Red flags for IT:

- With so much competition, will ViaFone be a survivor?
- Are enough customers demanding wireless to justify the cost?

emerging companies

delivers, says Ken Smiley, a senior industry analyst at Giga Information Group Inc. in Cambridge, Mass., is that it's technology-agnostic. The company is willing to work with all carriers, all types of connections and all kinds of enterprise systems. "I think that is an advantage long term in that market space," he says.

Possible Problems

One potential pitfall for ViaFone, Smiley says, is that the task of mobilizing enterprise applications is difficult.

"I don't believe that it's as easy, quick or inexpensive as people are led to believe by the marketing hype," he cautions.

That's led a lot of potential customers for ViaFone to wait for leading vendors to emerge with a proven product. The bad news for ViaFone is that it needs big clients to prove that its approach works and to pump some needed practical experience into the company.

Although ViaFone's client list contains some well-known names, not all of them are currently fully committed to wireless. McDowell describes his company's project, which accounts for less than 5% of the site's traffic, as an experiment.

"We want to get into this space, understand the technology and understand what users like and don't like," he says.

ViaFone has released a beta version of a software development kit, OneBridge Mobility Platform, that lets companies build and host their own mobile-enabled Web sites.

Smiley says a two-pronged approach — development platform and ASP — is a good move because customers want different things. But for a small company like ViaFone, maintaining growth and momentum on two fronts may be difficult, he warns.

The company expects revenue from OneBridge to grow to 80% of sales, says Desarnauts. Currently, all revenue comes from ViaFone's hosted services, which were launched in May. While ViaFone declined to provide actual revenue numbers, Desarnauts projects revenue this year in the seven-figure range. ▀

STATE OF THE MARKET

Join the Crowd

Analysts say the big job for ViaFone is distinguishing itself from the dozens of other vendors claiming to have a wireless application product or service. Carl Zetie, an analyst at Giga Information Group, says that in addition to vendors like ViaFone that come at the problem from the wireless end of things, ASPs are adding wireless capabilities to their offerings, hoping to capture that emerging business.

Giga analyst Ken Smiley says he sees two approaches being offered by vendors. One is content aggregation, in which data is sent between back-end stores and the mobile device. In this situation, content is static. A much harder problem is mobilizing applications so that mobile devices interact with back ends the same way that desktops do, by building mobile applications that change data and perform transactions.

Companies are pretty clear on the types of applications they want to mobilize, says Smiley. At the top of the list is the backbone of corporate communications: e-mail, contacts and scheduling. Next comes sales-force automation and inventory tracking, followed by help desk or customer service applications.

It's far too early to tell if ViaFone can pull ahead of the competition, says Smiley. "They could make a name for themselves, or they could fade away," he says. Not only is that true of ViaFone, he adds, but also of anyone else in this new field.

AvantGo Inc.

San Mateo, Calif.
www.avantgo.com

AvantGo is adopting the same dual-pronged approach as ViaFone — both internal development tools and a hosted service. It also has more than 1,000 partners that have built channels that feed information to wireless devices.

EveryPath Inc.

Santa Clara, Calif.
www.everypath.com

Purely a hosted service, EveryPath acts as a middleman between a Web site and wireless devices, essentially replicating the customer's Web site for mobile users. It supports transactions such as purchasing goods and auctions.

NetMorf Inc.

Boston
www.netmorf.com

SiteMorf is an XML-based development and server platform for e-commerce that focuses more on integration with back-end corporate databases.

South Florida Turns Up the Heat

Miami Beach

With Internet development skyrocketing and South American trade flourishing, the demand for IT workers is hitting an all-time high on the Sunshine State's southern shores. By Erik Sherman

FLORIDA has developed a reputation for having four industries: real estate, sunbathing, oranges and Mickey Mouse. Parts of the state are trying to counter those perceptions with "silicon" monikers. That includes southern Florida, which alternates between Silicon Beach and the Internet Coast.

Internet-related ventures here have been successful in obtaining one of the few network access points in the country, and there's growing potential for information technology professionals to find their place in the sun. But depending on your current location, you might find that the environment could burn your wallet as well as your skin.

Business Climate

There are certainly plenty of corporations needing IT help. A survey of central Florida alone, conducted by the University of South Florida in Tampa, shows a need for 11,000 more high-tech workers by 2003.

The American Electronics Association (AEA) and the Nasdaq Stock Market Inc. rank the state as sixth in high-tech

employment and seventh in the number of job increases in the sector. There are also large corporations in the state.

CSX Technology Inc., one of the six largest railroads in the U.S., has an IT staff of 600 in Jacksonville. Arthur Andersen LLP has a major global IT center in Miami, while Tampa is home to PricewaterhouseCoopers' main training center.

IBM and Harris Corp. are longtime residents, and there are many government and aerospace opportunities near Cape Canaveral. Growth has been strong in Internet-related companies throughout the state.

"There are more than 5,000 computer and Internet and communication service companies in Broward and Palm Beach counties today," and that comprises a small part of the state, according to Ann Salamone, CEO of Enterprise Development Corp. in Boca Raton.

Southern Florida has also become a strategic location for companies looking to do business in Latin America. Startups will continue to flourish in the medium term "just because the other markets are very saturated and competitive for the venture capitalists," says Jeff White, senior vice president

and manager at the West Palm Beach office of Silicon Valley Bank, a Santa Clara, Calif.-based commercial bank that invests primarily in the IT sector.

Yet, not all is rosy. The AEA ranking also shows that the number of high-tech employees, as a percentage of private-sector workers, in Florida is 20% below the national average. Although the absolute number of job increases was high, the percentage was also below the national average.

Agriculture and tourism are "still probably the majority" of businesses in the state, says Guy Hagen, assistant director of economic development at the University of South Florida.

Strong Job Market

Nonetheless, Florida has a good job market. "It's not different than it is for us in Philadelphia or Atlanta or New York," says Ted Fernandez, CEO of Miami-based Answerthink, which has offices in these other cities. "There's a fight for experienced talent."

Rapid growth means there's also a particularly strong need for IT directors and others with project management experience. Also needed are Web developers, database experts and people with experience in enterprise application integration.

According to Wayne Coonan, national accounts director at MRI Tampa Corporate Offices, Cisco experts with Cisco Certified Internetwork Expert ratings and Solaris gurus are also in hot demand, as are people who understand how systems can work together.

"A [job] title that we had a need for [was] an IT architect — an individual who can come in and really help us design and... make sure we are doing the right things moving forward," says Jack Morgan, assistant vice president of human resources at CSX.

Although demand for IT workers may be strong, don't expect to make the same mon-

ey the market in other states offer. Salaries are "clearly 10% less than the national mean," says Dan Smith, managing partner at MRI Tampa.

"[Compared with] the higher-cost markets like LA and Boston, we're probably 20% or 25% lower," says Smith. In addition, the cost of living is probably right at the national average. There is no state or local income tax, but there are sales taxes and other charges.

"We talk of ourselves being a lower cost-of-living state, but we're not," Smith adds. "We're nickel-and-dimed on many things, like toll roads."

However, if someone enjoys outdoor activities, fine dining, cultural activities and night life, there may be a spot in the state to soothe cash-flow cramps. Schools are "not bad," says Jan Nelson, director of global services at Newburyport, Mass., relocation firm Mobility Services International Inc. "But in terms of comparative merits, they wouldn't rank as high as schools in California and the Northeast," Nelson says.

IT workers relocating to Florida from other parts of the country may have some adjustments to make.

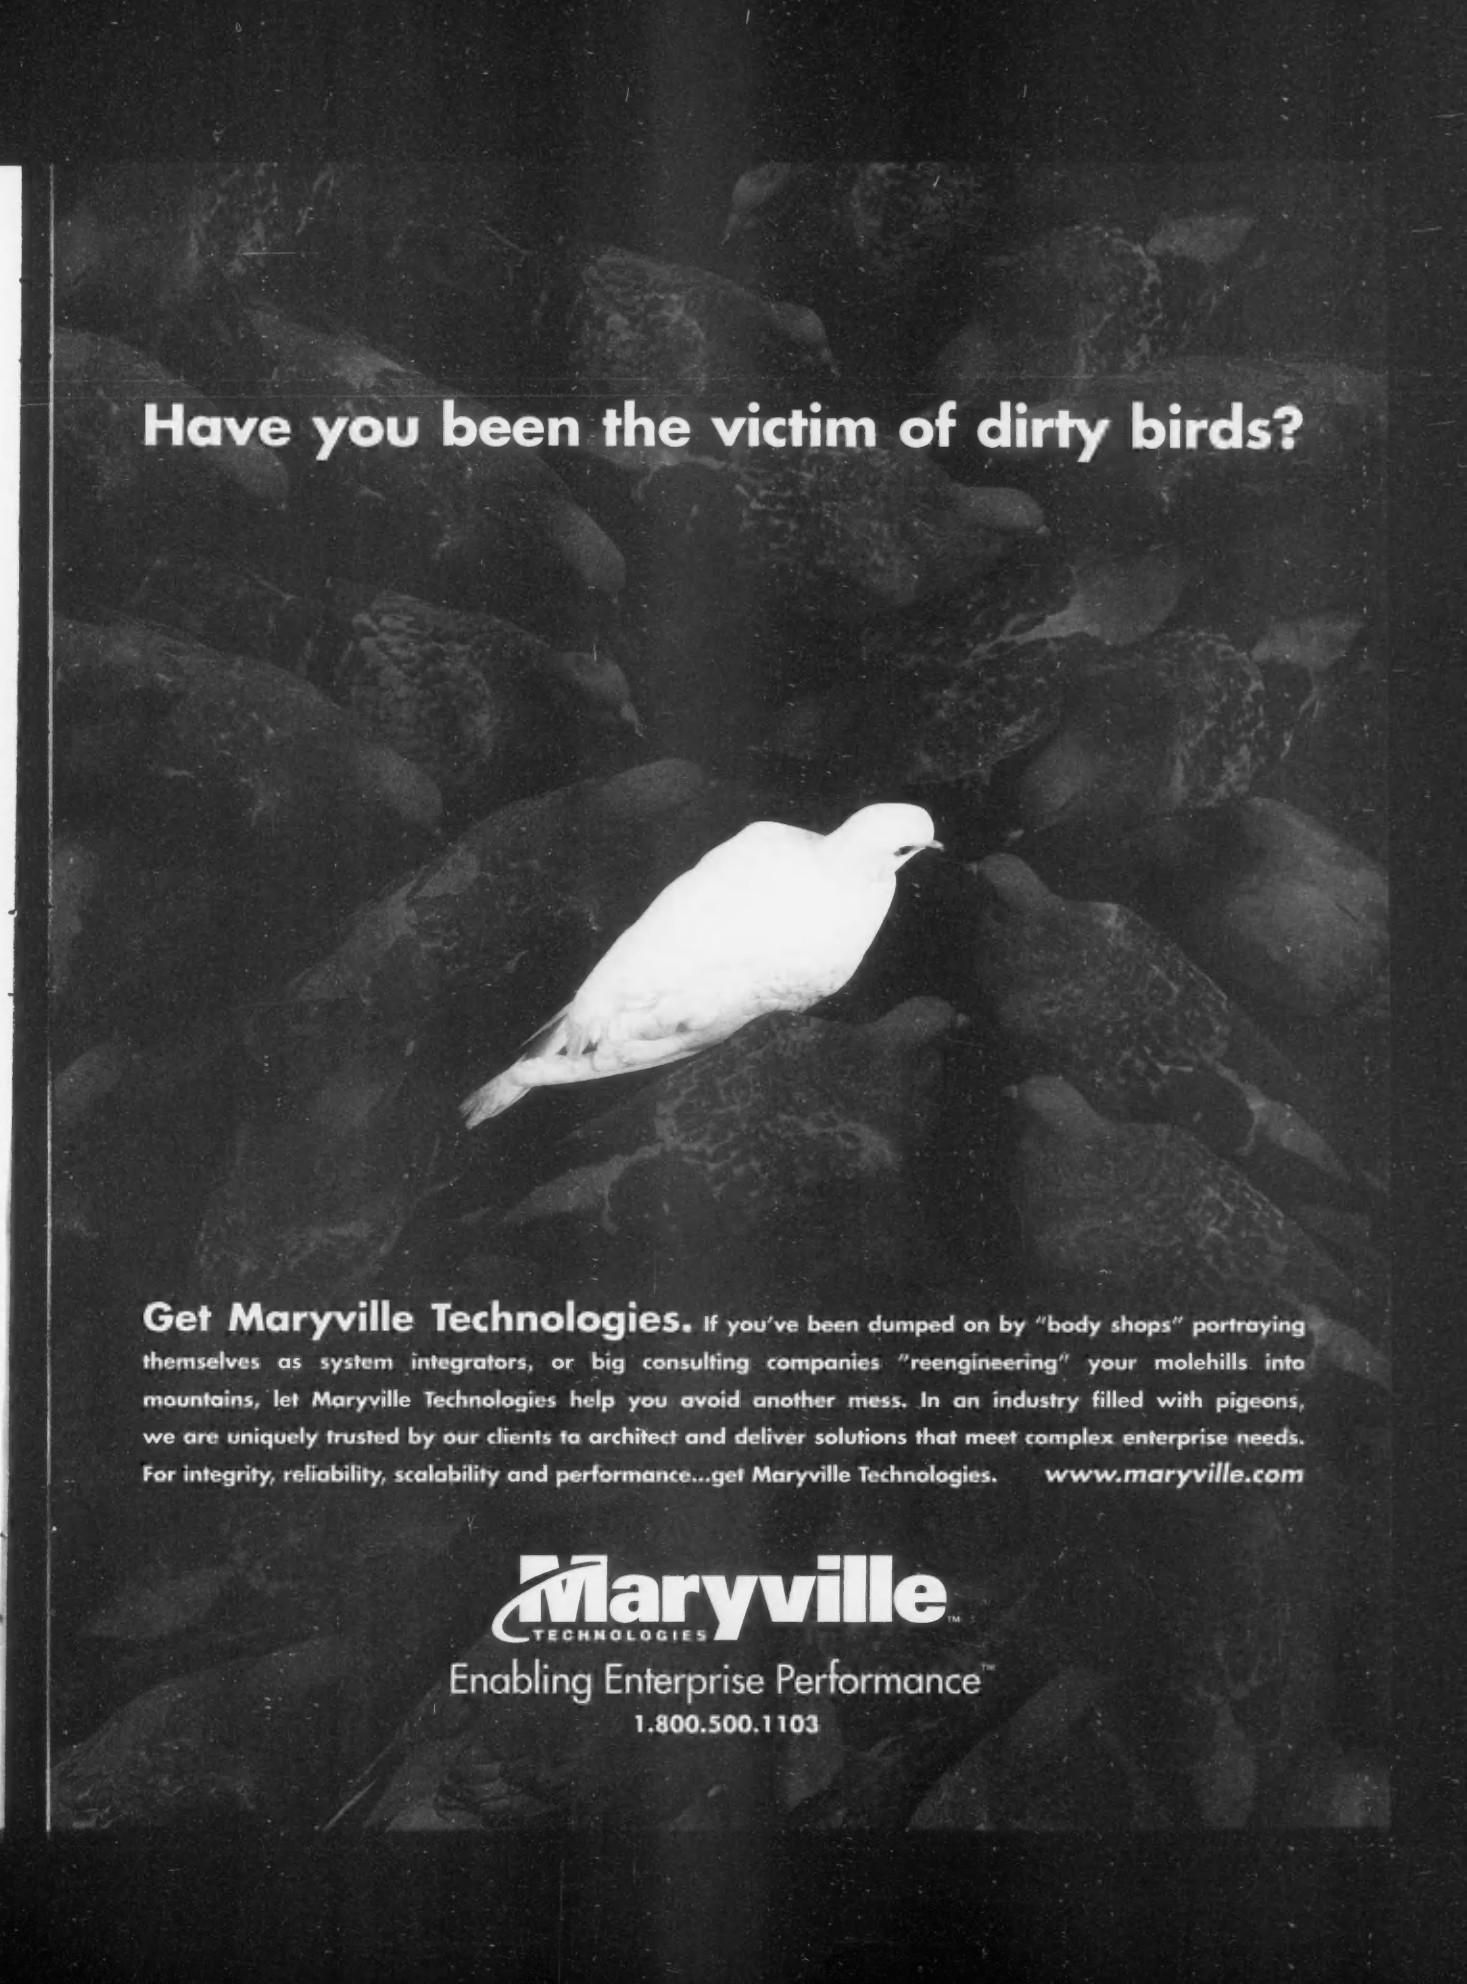

John McVey, an IT architect at CSX, has twice relocated from Pennsylvania. "The South has a stereotype of moving a little slower than the North," McVey says. "I wouldn't say that's necessarily true."

A fast-growing population can also make it easier to fit in. "There's a number of growing communities, and that has put people in many instances in a similar situation, where they're all relatively new to the area, and there's more of a sense of community than in well-established Northern communities, where people have been living there for generations and you have to break in, and its difficult," says McVey.

In general, though, people from certain areas of the country will find relocating to Florida easy to adapt to.

"Florida works well for people transferring in from the West Coast. People are delighted because of the much lower costs of real estate and the many choices they have," says Nelson. ▀

Bachelor's degree in Computer Science, Computer Engineering or Electrical Engineering, or related field or foreign equivalent.

If interested, please email your resume and cover letter to jobs@thoughtworks.com.

Diversity Not a New Issue for These Companies

Over the past 15 years, business discussions concerning diversity have moved from "it's the right thing to do" to "it's a business imperative." The change has been the recognition that being able to attract the top talent - regardless of gender, color, education, background or age - is a priority for any business.

Kellogg Company Battle Creek, MI

"Diversity at Kellogg is a matter of practicing what we preach," says Andre Goodlett, Kellogg associate director of staffing. "We have diversity in our leadership, and the demographics at every level reflect a diversity of color, gender and background."

While the face of Kellogg is a diverse one, the head of the Diversity department reports to the Office of the Chairman, assuring that valuing differences remains an important part of business operation. "Diversity isn't a once a year thing here," adds Goodlett. "We have the programs and events, but more important is that we understand that a talented, diverse workforce is the lifeblood of our company."

This talented, diverse workforce carries through to the IT organization for the company best known for Tony the Tiger™ and those zany guys Snap, Crackle and Pop™. "We're in an exciting time for IT," Goodlett says. "Our e-commerce program is multi-faceted, including a brand loyalty program known as EAT and EARN™ and the more traditional e-commerce aspects of operations management. Our web site has always been a leader, but we are pumping it up on a continuous basis."

IT positions at Kellogg include database management, analysis, network architecture design and management, system integration, ERP systems and project management. "Because IT is a driving force behind our business, there is a lot of opportunity for hands-on experience," says Goodlett. "We have complex projects across multiple technologies. If you're interested in making a contribution and being able to go as far as your talents allow, this is the place."

KPMG Consulting, LLC

Dallas, TX

Sean Huurman, national director of recruiting for KPMG Consulting, believes technological innovation and the war for talent have created the business imperative of diversity. "It's not just a socially conscious thing to do, it's a strong business decision," he says.

"As the technologies have continued to develop and vary, we're finding new strongholds of technology expertise, which also adds to the diversity of the organization," Huurman says. "We also are seeing an increase in effort at U.S. schools to recruit and graduate diverse candidates."

Globalization also has created diversity needs. "For instance, as we work with Latin American communication companies, we know they won't settle for consultants who don't understand the culture, the community and the directions in terms of what they are looking for," Huurman says. "English may be the global language, but it is very much a second language for many of our clients. It's up to us to be able to communicate, not up to our clients."

KPMG Consulting expects to fill 3,500 IT positions in 2000. The company is recruiting for all types of e-commerce, m-commerce and basic technologies - Java, C++, Portal and Cobol, as well as skills required for billing and call centers. The company has locations in 825 cities worldwide. "Technical skills are important," says Huurman, "but more important is understanding how technology plays out in the work day for the individuals who will use the technologies."

"We don't organize around individuals or differences," says Huurman. "We organize around our work. Any job candidate, regardless of race or gender, is looking to use the skills they know, to learn new skills and new technologies. And we offer that to every candidate who walks through the door. Our job is to build relationships across the firm that support our employees. The number one selling point for us is that we consider ourselves a \$2 billion startup. We are pre-IPO, we play in an exciting e-business space. The key difference is that we have the knowledge and backing of a stable, revenue generating organization."

Pitney Bowes Mailing Systems Division Stanford, CT

For over seven decades, Pitney Bowes has been a corporation focused on ensuring that their employee population reflects their customer base and their communities. The result is a company whose history is steeped in valuing diversity, where diversity is a

part of the business planning process and where diversity is valued because of its ability to create new ideas and innovations.

"We're a company that takes pride in the number of inventions and patents we hold," explains Linda Stephenson, director of staffing. "We have lab units within the company, places where employees can go to invent new products. It's a fantastic play space for the technologically talented, where they can go and create."

Marie Radcliff, manager of diversity and compliance, says this innovative approach is possible because the company has paid so much attention to diversity. "We were 'sending' the message long before most companies were 'getting' the message about diversity," she claims, pointing to the company's pro-active outreach efforts, which predate the Civil Rights Legislation. The result is that Pitney Bowes has made it a function of business, continuously conducting research to assure that the company's job openings get in front of the faces of diverse people. Today that means everything from working to identify new and emerging web sites to ensuring all audiences have equal access to Pitney Bowes Mailing Systems' opportunities. Pitney Bowes Mailing Systems will be participating in the Women of Color Technology Conference in Orlando.

Currently, Pitney Bowes Mailing Systems is reinventing its IT organization. The division has identified emerging technological needs, the skills needed to support them, and the jobs required. The jobs range from an IT leader for the human resources group to web developers, e-commerce experts, network developers, storage and database managers and analysts, platform integrators and client/server leaders. "The projects being designed now vary from enterprise messaging, network design, supply chain and e-commerce to new services that we will provide to small and large business customers," says Stephenson.

"You can be an individual contributor or a member of one of our project crews," she adds. "Pitney Bowes is a great place for people who want to invent and create, who are looking for strong work/life balance and support for continuous learning. We look inside first for our leaders, and that requires that we continuously look at skills that will be needed and provide the opportunity to gain those skills."

NEWS

Continued from page 1

Corporate Cable

Over the past five months, First Hawaiian has connected 600 desktops to the high-speed (10M bit/sec.) Oceanic service. It expects to have 1,000 desktops hooked into the cable system by the end of the year.

Takahashi said Oceanic provides him with faster and more reliable service at a lower cost than similar offerings from the local phone company, a subsidiary of New York-based Verizon Communications. Takahashi said that when his company priced comparable high-speed services from Verizon 18 months ago, the phone company's rates were "almost double" those of Oceanic.

Verizon failed to return calls for comment by press time.

Homegrown Demand

Oceanic spent \$75 million eight years ago to upgrade its cable network to support two-way, high-speed data service for its 300,000 residential subscribers. It initially had no intention of serving the corporate market because it didn't anticipate that there would be any demand, said Kiman Wong, the company's general manager of Internet services.

But "once people had [Road Runner] at home, they wanted it at work," Wong said. The company now services 1,300 commercial accounts. To beef up its commercial business, Oceanic developed a suite of corporate access products, offers Web hosting services and plans to extend its commercial reach by wiring the urban core of Honolulu, Wong added.

Cox Business Services, a division of Cox Communications Inc. in Atlanta, is another cable company that is pushing toward providing high-speed Internet access for businesses. Users said they're pleased to find a cheaper alternative to the local phone company.

Jim English, chief financial officer at Lopez Foods Inc. in Oklahoma City, said Cox's "aggressive" pricing for its high-speed service was a key factor in choosing Cox over South-

western Bell Telephone Co., a subsidiary of SBC Communications Inc. in San Antonio.

Lopez, which produces hamburgers, sausage and Canadian bacon for McDonald's restaurants, has 75 users hooked up to the Cox service and plans to use it in its new executive office building. The high-speed connection "means people are not sitting here twiddling their thumbs waiting for their e-mail," English said.

Cox, which operates as a competitive local exchange carrier in Oklahoma City, offered Lopez a package of services that included high-speed data and phone service priced 41% below Southwestern Bell, which subsequently made a counteroffer. But Cox still charges 12.5% less than the deal offered by Southwestern Bell, English said.

Ken Tyself, director of DSL business/retail at SBC, acknowledged growing competition with cable TV companies for the corporate market. "They're munching at our business, but we're also munching away at theirs," Tyself said. "Clearly, competition is increasing in broadband ... but we believe we have as good or better offerings as theirs."

David Barnes, an information systems manager at National Loan Investors LP, a mortgage servicing company in Oklahoma City, said connectivity, not price, prompted him to choose Cox over Southwestern Bell. "We're at the end of their copper plant, and they could not offer us the service we needed," he explained.

National Loan is in the process of upgrading its service to a dedicated T1 line and a hardware virtual private network. It's sticking with Cox, Barnes said.

Barnes said he uses his residential Road Runner service to manage batch processing on office servers at night. "It's much more convenient from home," he said. "And I can do everything I need to do, [including running] diagnostics."

The business of providing high-speed cable services to corporate America is in such a stage of infancy that The Insight Research Corp. in Parsippany, N.J., was "surprised" to discover the inroads it has started to make, said Christopher Whitley, project manager for a recent study on Digital Subscriber Line vs. cable.

"We started the study with the preconceived notion that cable provided only residential

service ... but we quickly got an indication that there was also a business market," Whitley said. "It's still in its early stages but should grow over the next five to 10 years."

By 2005, Insight predicts, the U.S. will have an installed base of 32 million cable modems, generating \$15.5 billion per year in revenue. The research firm didn't break out business vs. residential data.

Road Runner LLC in Herndon, Va., owned by AT&T Corp., Time Warner, Microsoft Corp., Compaq Computer Corp. and Advanced Communications-Newhouse, foresees growth in package plans for businesses that want high-speed access for teleworkers.

Mark Mercer, vice president of commercial services at Road Runner, said he intends to pursue as much corporate business as he can land. But, he added, he believes that growth will come even more quickly from package deals for remote workers or telecommuters in the 44 Road Runner markets nationwide.

"We're going after national accounts for telecommuters," Mercer said, "with a great deal on a bulk price for corporate accounts." ▀

Cable's Coming

Representative corporate cable data pricing:

OCEANIC CABLE

Road Runner Pro
Supports up to 10 users through a hub at \$79.95 per month

Road Runner Pro-X

Adds proxy server to basic service, with each PC connected to the server costing \$9.95 per month above the basic charge of \$79.95.

► Doesn't include a fixed IP address

Road Runner LAN

Unlimited number of PCs can operate behind proxy server at a cost of \$350 per month

► Includes fixed IP address and DNS

COX 'AT WORK' PROFESSIONAL

► 26 to 50 users, one IP, \$895 per month

► For more than 50 workers, \$100 additional per month per block of 25 users

► \$50 for each additional IP

► Installation charge of \$995

► Rates lower on three- and five-year plans

Recruiting

often means hiring people right out of college.

At Washington-based Potomac Electric Power Co., the focus also has been on hiring IT rookies such as new college and technology-school graduates. "We do want to retain our people," said Ken Cohn, the utility's CIO. "On the other hand, we know that we're not going to in all cases. And so what we're trying to do is constantly backfill with rookies, young talent ... that we can train quickly."

Mendes, Cohn and other IT executives discussed labor issues as part of a panel at the 2000 Greater Washington Technology Showcase conference and technical expo. Members of the panel said the key to

hiring and retaining workers is being flexible with employee needs and staying in tune with their career goals and plans.

If companies provide their employees with viable career paths, educational opportunities and the ability to work with new technologies and "give them a life that is semi-sane," retention rates tend to be high, Mendes said.

But Mendes said IT man-

Be Flexible

Filling vacant IT slots takes creativity and flexibility, say CIOs:

Invest in training: Hire talented rookies and older workers

Offer workplace perks: Job-sharing, telecommuting and flexible hours, for example

It's not just a job: Create a career path for IT workers

agers should also think about hiring more minorities and disabled people. Older IT workers with skills no longer in demand also have potential, he added:

"If they had the ability, from an intellectual standpoint, to learn the legacy systems, why can't they have the ability to learn the new systems?"

The need to be creative in employment matters is being driven, in part, by the continuing IT labor shortage, Mendes and other panelists noted. For example, Meta Group Inc. in Stamford, Conn., estimates that there will be 850,000 vacant IT jobs in the U.S. by year's end.

Fairfax County, Va., has succeeded in filling all but 13 of its 367 IT positions by emphasizing its flexibility on issues like job sharing and by making few extra demands on a workers' time, said CIO David Molchan. Employees rarely have

to work on weekends, except on special projects. Even then, "it's nothing like the grind of the private sector," he said.

The federal government, which is facing a pressing need for IT help because of growing numbers of retirement-eligible workers, is attractive to people who aren't primarily motivated by salary, said Alan Balutis, director of the advanced technology program at the U.S. Department of Commerce. "Not everyone wants to work 80 hours a week with a chance at being a millionaire at some point in their life," he said.

But one thing the federal government can't do is move quickly to extend an offer to a potential employee, Balutis said. Getting a federal job frequently can take 60 to 90 days. "I couldn't compete [with the private sector] even if they gave me monies to match the salaries," he said. ▀

FRANK HAYES/FRANKLY SPEAKING

The name game

TAKE FIVE MINUTES and try something: Make a list of the 10 Web addresses you'd be most likely to guess for your company's Web site if you didn't know its actual domain name. (If you can't think of 10, throw in a few likely misspellings to pad out the list.) Now test them with a Web browser. Any surprises? There really shouldn't be, but there probably are.

Find a few other people in your IT shop and ask them to make the same kind of list. Then test their lists. A few new guesses, a few more surprises, right?

Now ask some friends or family members to make the same sort of list. Try to get a wider range of ages and personal backgrounds into the mix this time. Still more guesses, still more surprises — but you're starting to see patterns, aren't you?

This is how customers actually use the Web: They guess. A lot. Once they've found a Web site they want, they may bookmark it. If the first few guesses don't pan out, they may use a search engine. But there's a lot of guessing going on out there.

And it's a good idea to keep track of what they're likely to be guessing — and to find out where those guesses will take them.

Say you work for a U.S. airline, for example. United-air.com is the address of a Taiwanese air-compressor company. American.com leads to Cisco Systems. Deltaair.com and Continental-airlines.com take a customer to the same travel agency, and continentalair.com to a different travel agency. Us-air.com, Transworld-air.com, Alaska-airlines.com and Southwestair.com are owned by the airlines you'd expect but aren't connected to the appropriate Web sites.

And that doesn't include domain names owned by companies that have names similar to the airlines but no Web sites. Or domain names owned by cyber-squatters. Or any sites a customer would hit by mistyping the name (Untied.com, for example, is a site for complaints about United Air Lines).

And this is just a snapshot from October 2000. In a month or a year, more chances for confusion could crop up.

Confusing customers is something you want to avoid. Your marketing department may be spending buckets of bucks promoting your site.

*This is how
customers
actually use
the Web:
They guess.
A lot.*

e-mail and Web surfing may have gone astray.

So play the name game. Play it often. Keep testing the results. Because on the Web, as long as your company's customers are playing guessing games, you should be too. ▶

SHARK TANK

PLUG IT IN Lone IT pilot fish at a manufacturing plant must add two PCs where there's only one network connection. "Simple solution — I just use a minihub to connect both computers," says the fish. But early one Saturday, fish gets a call: The two users can't log on. PCs are on? Check. Cables and power cord connected? Yes, the users swear. Fish sighs, climbs out of bed, drives to the plant, hikes to the remote section of the plant — and plugs the power cord back into the hub.

TURN IT ON After 10 minutes on the phone troubleshooting a monitor problem ("Monitor is broken and user has been unable to get on his computer for days, he says"), LAN admin dispatches support pilot fish to the user's office. After a moment's inspection, the fish pushes the power switch on the user's monitor to turn it on, and then reboots the PC — which had been in power-save mode.

TURN IT OVER A user needs help resynchronizing the stylus for his PalmPilot. "Look on the back of the PalmPilot, and you'll see a tiny hole with the word re-

set beside it," fish says. Not there, says user. Fish trudges over and discovers that the user has flipped open the handheld's leather protector, which now covers the back instead of the front of the PalmPilot. Fish closes the flap. "Oh, there it is!" says the user.

PULL THE PLUG Is our uninterruptible power supply (UPS) system adequate? new IT boss asks. Sure, pilot fish answers: "Each server is on its own UPS with 30 minutes' battery time. I live close and am paged when the machines go down." "What about this one?" the boss asks, pointing to the e-mail server. "Is it ready for testing?" Fish nods — and the boss dramatically grabs the power cord and pulls it straight out of the back of the server. The machine instantly stops dead. "I thought you said these things were on UPSes," boss complains. Result: 11 a.m. to 3 p.m. with no e-mail.

SIEMENS

We're making business mobile. See how your business can profit at: www.siemensmobilebiz.com

He won't shop in supermarkets

He won't commute to an office

And he'll do his banking from wherever he is

Make your business mobile

The world is changing. And people's habits and needs are changing with it. Very soon, more than 200 million people will go shopping, bid at auctions, visit the bank and book their travel on the move – via the Internet – thanks to Wireless Application Protocol, or WAP, mobile phones. Are you prepared? We are.

Siemens makes business mobile. From entire networks to mobile devices, we provide the latest in voice, data and video communication equipment and services – including an entire range of mobile business solutions.

We're the only company who really understands how to make it all work seamlessly.

We'll keep you up to date with new technologies and an endless stream of new ideas.

Because one thing is for sure: It's today that determines who you'll be doing business with tomorrow.
